Revision History

	Date	Authors	Organization	Description
v.1	1 February 2014	Pietro Liuzzo, Herbert Verreth	UHEI, KULeuven	Deliverable was put together from the work of the WG1 and 2.
v. 2	10 February 2014	Pietro Liuzzo, Silvia Evangelisti, Raffaella Santucci, Vittore Casarosa, Franco Zoppi, Valentina Vassallo, Claudio Prandoni	UHEI, UNIROMA1, CNR-ISTI, CYI, PROMOTER	Parts added as suggested in feedbacks, corrections made to first part, added list of contributors
v. 3	25 February 2014	Pietro Liuzzo, Ioan Piso, Antonio Felle	UHEI, UBB, UNIBA	Corrections made to first part, added fuller list of contributors, further specifications to vocabularies. Ready for review.
v. 4	12 March 2014	Pietro Liuzzo, Franco Zoppi, Francesco Mambrini	UHEI, CNR-ISTI, DAI	Reviewed and updated.

More details on contributors of each section can be found where appropriate.

Statement of originality:
This deliverable contains original unpublished work except where clearly indicated otherwise. Acknowledgement of previously published material and of the work of others has been made through appropriate citation, quotation or both.

Abbreviation	Meaning
SKOS	Simple Knowledge Organization System
HE	Harmonization Effort
HT	Harmonization Tools
URI	Unique Resource Identifier
WC	Wikimedia Commons
WP	Work Package is one of the main parts in which the Eagle Project is articulated • WP1: Project management • WP2: Networking and best practices • WP3: Metadata model, mapping and ingestion • WP4: EAGLE Aggregator and Image Management infrastructure • WP5: End-user dedicated services • WP6: Dissemination and exploitation
WPL	Work Package Leader. These are: • WP1: Promoter • WP2: UHEI • WP3: CYI • WP4: CNR-ISTI • WP5: DAI • WP6: UNIROMA1
WG	Working Groups are the core groups of activity in WP2. They are: • WG1: GIS and Terminologies • WG2: Translations and content curation • WG3: IPR and User Engagement

Summary of all Best Practices and Harmonization Actions

Best practices

BP 1: Responsibility towards users 5

BP 2: Interaction and Networking 5, 50, 60

BP 3: Toponyms and identifiers 19

BP 4: Variant names 19

BP 5: Spelling Harmonization 19

BP 6: LOD 33, 50

BP 7: Harmonization 33

BP 8: Multilingualism 33, 50

BP 9: Open Software 33

BP 10: Usability 50

BP 11: Shared online bibliography 50

BP 12: Raw data online 60

BP 13: Automatization and curation 60

BP 14: Semantically meaningful data 60

BP 15: Openly accessible XSL stylesheets 60

BP 16: Synchronization with other major projects 69

Harmonization Efforts

HE 1: Networking and related contents 19

HE 2: Vocabularies alignment 33

HE 3: Definitions 33

HE 4: Relations 33

HE 5: Collecting translations 50

HE 6: Conversion and Crosswalking 60

HE 7: Simplification of workflow 60

HE 8: Metadata Curation 69

Harmonization Tools

HT 1: XSLT for harmonization of places id and URI 19

HT 2: The EAGLE Vocabularies 33

HT 3: XSLT for harmonization of vocabularies id and URI 33

HT 4: Eagle Wikibase 50

List of Contributors

The following list includes members of the Working Group on GIS and terminologies and all those members of the international community which provided support with feedback, initial suggestions, documentation, technical support, and all other forms of direct and indirect participation in the development of the contents of this deliverable, via personal meetings, conversations at conferences and events, online meetings, mail exchanges on mailing lists, etc. . We would like also to acknowledge here all those contributions which would not be possibly referenced otherwise. While contributions have been stated precisely where possible in the deliverable, it should be underlined that the responsibility for the contents stays with the project members.

Executive Summary

This Deliverable on *Content harmonization guidelines, including GIS and terminologies* is the first release of a document defining best practices selected and put in practice during the activities of the Working Group on content harmonization, GIS and terminologies (WG 1) as well as the Working Group on Translations and Content Curation (WG 2, D2.1 2013, 15f.).

The vocabularies, defined and maintained by identification and mapping of terminologies in use by the Content Providers, as well as all other tools adopted and developed which are here presented:

- aim to ensure the continuous addition of qualitative and quantitative attractive content by the EAGLE BPN;
- are designed to be extensible and inclusive in order to facilitate enrichment and harmonization of metadata using controlled vocabularies and gazetteers (Description 2013, 25 part B);
- foster in a most practical way interoperability and integration of the content providers systems, in order to enrich the value of the aggregated epigraphic content (Description 2013, 11 part B);
- are developed to produce and support the creation of further Linked Open Data resources and annotations;
- take into account the latest break through developments;
- are aligned to the development of the Metadata schema and of the EAGLE portal.

Therefore the results here presented are, in the order in which they appear in the document

- the principles, methodology and results of the gathering in Trismegistos - Places of all GIS information provided by Content Providers;
- the Vocabularies developed by the WG on all shared fields of information and the methodology used to produce and maintain them;

- efforts in the harmonization of contents, including translations and bibliography;
- tools to facilitate harmonization XSL Transformation stylesheets developed to support the integration of vocabularies in the metadata model.
- partnership established in the framework of the Networking Task (D2.1 2013, 7f.) to enhance results at the best possible level for the international community.

At the end of each chapter is available a list of the key best practices involved, which are also listed in a summary at the beginning of the document.

All the tools developed are available and free license software and content, embrace the Linked Open Data principles and strive to be challenging new directions for the development of a top quality network of resources in the BPN (Description 2013, 53-4 part B).

Chapter 1

Introduction

Zeng and Chan 2006 in their work on Metadata interoperability say

> the results of efforts to improve interoperability can be observed at different levels:
>
> **Schema level** Efforts are focused on the elements of the schemas, being independent of any applications. The results usually appear as derived element sets or encoded schemas, crosswalks, application profiles, and element registries.
>
> **Record level** Efforts are intended to integrate the metadata records through the mapping of the elements according to the semantic meanings of these elements. Common results include converted records and new records resulting from combining values of existing records.
>
> **Repository level** With harvested or integrated records from varying sources, efforts at this level focus on mapping value strings associated with particular elements (e.g., terms associated with subject or format elements). The results enable cross-collection searching.

In this guidelines the second level is the main aim. The work has been carried out following the methodologies outlined in D2.1 with the collaboration of all the members of the working group. Aim of the two working groups involved in this tasks (WG1 on GIS and Terminologies especially, but also WG2 on Translations and Content curation) is the harmonization of entries in the different databases under all possible aspects without flattening existing divergences. This tasks have been faced in the framework set by the work on the Eagle Metadata Schema and its foreseen developments (D3.1 and *addenda*) which dealt with the first of the

levels mentioned above mainly. All guidelines for interoperability and harmonization here suggested are also thought about with the third level in mind as well as with attention to the work being done on mobile applications, interface (D4.1) and portal requirements (D5.1).

The data aggregated by the Eagle BPN and its new affiliated members, collaborators and partner projects is very heterogenous in format, quantity, background concepts of data etc. Efforts towards record harmonization had in most cases therefore to be limited to a specific subset (metadata of texts of inscriptions), although all that could be done to harmonize the whole data involved has been done.

For the whole set of aggregated contents the Eagle BPN focused on mapping and harmonization of Geographic information and bibliographic information (and partially of controlled vocabularies), two major tasks eased by the existence among the Content Providers of contents which were already structured. This does not decrease the amount of work required to curate contents, eliminate duplicates and obtain tools of real interest and usability for a typically very skeptical community of users (classicists, epigraphists, ancient historians, etc.).

The subset of information related instead to the metadata of texts of inscriptions provided the occasion to work on the harmonization of a metadata format for aggregation according to the existing international standards; and secondly to undertake an effort towards a major *desideratum* of our user community: the harmonization of controlled vocabularies and terminologies.

Overall best practices

What we believe in fact to be key to useful guidelines is the responsibility towards the **users** and groups interested in the content provided for quality and commitment to the same research purposes. This is the reason of the close connection and interaction of this guidelines with the efforts of User Engagement tasks.

On the other side as second key best practice we have, and we continue to, activate as many useful partnerships with sister projects as possible, to enhance the possibilities to reach the needs of the first key best practice.

Interaction is key to real success both in interoperability for the production of useful linked data (ancient data in the case of EAGLE). To this respect this guidelines ought to the LAWD (Linked Ancient World Data) community, the Epidoc Community, the Europeana Network, the Pelagios Network and the Perseus project a wealth of opportunities to practice this key best practice which is interaction.

These guidelines therefore always keep the above two points in mind and reasons for the choices made in the points suggested are based on these two points.

Key Best Practices Summary for this section

BP 1: Responsibility towards users Seek best quality and usability. Understand needs of main groups of users and focus efforts towards task which bring direct benefit.

BP 2: Interaction and Networking Understand differences, involve stakeholders, build skills as well as tools to simplify harmonization in the interest of everyone and with an eye to the future.

Chapter 2

Geographical Informations in Trismegistos

2.1 Definitions

> The most fundamental advantage of the emerging networked knowledge environment is that it provides a much-improved technological basis for sharing resources of all sorts from all sources. This situation increases the importance of effective access to information. Place, along with time, topic, and creator, is one of the fundamental components in how we define things and search for them. (Buckland and Lancaster 2014)

Due to this consideration and its implication it is important to better define the terms which come into play first of all: *place* and *toponym*.

2.1.1 Place

Among many possible definition available, the working definition adopted here for "Place" is the one used at Trismegistos.

> The term 'place' is used in the broadest sense, referring not only to towns and villages, but also to regions, districts and to all kinds of micro-toponyms (e.g. town quarters and streets, kleroi and other plots of land, rivers, sanctuaries.[1]

[1] Contents in this section are taken from Trismegistos.

2.1.2 Toponym

Toponym

A place can have more than one name (*Toponym*), depending on the language, the period or the type of text; e.g. the names Apollonopolis Megale (Magna) / Ano (Superior), Apollonias, Behdet, Bachthis, Polis Phoibou and Mesen all refer to modern Edfu.

All toponyms referring to one place are listed on a single card, which has a unique TM Geo_ID number. This number contains no information, but is just created in a numerical order.[2] With regard to ancient places it is not always clear what is a real toponym and what is a common noun referring to a geographical item (also called appellatives in linguistic studies). Any toponym listed in the geographical index of a publication is also listed in the geographical database.[3]

2.1.3 Workflow

Variants

For every ancient place the different names are listed in separate fields, one for every ancient language used: 'Greek', 'Latin', 'Egyptian' (sc. hieroglyphic, hieratic, demotic), 'Coptic'. The names in the fields 'Greek', 'Latin' and 'Coptic' are written in the script of the sources (with a Unicode alphabet); in the field 'Egyptian' a Unicode transcription is given, no facsimile of the original hieroglyphs or script. In the field 'Other' Latin alphabet transcriptions are given of toponyms in other languages such as Arabic, Hebrew, Nabataean, Meroitic, Old Persian and Assyrian. In the field 'Modern' the name is written (in Latin alphabet transcription) of the present-day toponym that corresponds with the ancient name. The names in all these fields are 'standardized' to a certain extent, the way one expects in the geographical index of a book. In the field 'Variants' all these names are brought together in Latin alphabet transcriptions, and other variant spellings or translations of the names can be added. To facilitate searching by non-specialists, the transcriptions in this field contain as little diacritical signs as possible. For Egyptian names the scientific transcription is therefore replaced by a more phonetic one (e.g. Ḫfṯḥ-n-Bḫ > Chefeteh-n-Bouchis). Greek names are transliterated into the Latin alphabet, not translated into Latin, although a common Latin form can be added as one of the variants (e.g. Ὀξύρυγχος > Oxyrynchos, variant Oxyrhynchus). For some very common names (e.g. Egypt, Alexandria, Thebes) the English spelling is used. From all these variants a standard name is chosen both for the ancient and the modern name. The ancient standard name is displayed in the field 'Standard', the modern name in the field 'Modern' already mentioned. If a place has no ancient name, the modern name is displayed in the field 'Standard'.

[2] If two places are identified and their cards joined, the Geo_ID number of the old card is preserved but henceforward contains only a reference to the new card.

[3] Talbert 2000, Vf. gives complete guidelines on this theme as a supplement to the maps and Gazetteer of the Barrington Atlas.

2.1.4 Modern Toponyms

It is not always easy to determine which modern name should be used to refer to an ancient site. The name of the modern hamlet, the village, the town or the major city in the neighbourhood, all these modern names can be used to refer to the ancient site. If this is the only site on the territory of these places, one can list all four names next to each other in the field 'Variants' and pick as standard the name most commonly used in scholarly literature to refer to the site, without any risk of confusion. If there are, however, several sites on the territory of the town, it is best to choose the name of the hamlet or village as standard name and to refer to the town in the field 'Location'.

Another problem arises when a major city covers a lot of modern toponyms and when it is important not to loose the information about the different actual sites where documents have been found. These sites are put separately in the field 'Variants', preceded by the phrase 'sites including ...'; e.g. L00 Alexandria - sites including Kom el-Dikka; L01 Memphis - sites including Saqqara. The Provenance file (see below) contains a field for the information about these specific sites.

A geo-card has been created for every toponym in the full lists, referring to the place where an inscription has been found or written.

The process of data control has therefore been dialogical: the update of information in Trismegistos has been a way to clarify possible inconsistencies in a bi-directionally valuable work of curation of contents.

All these toponyms have been processed into the Trismegistos Geo file, which now counts 36.697 toponyms, from all over the *Imperium Romanum* and beyond.

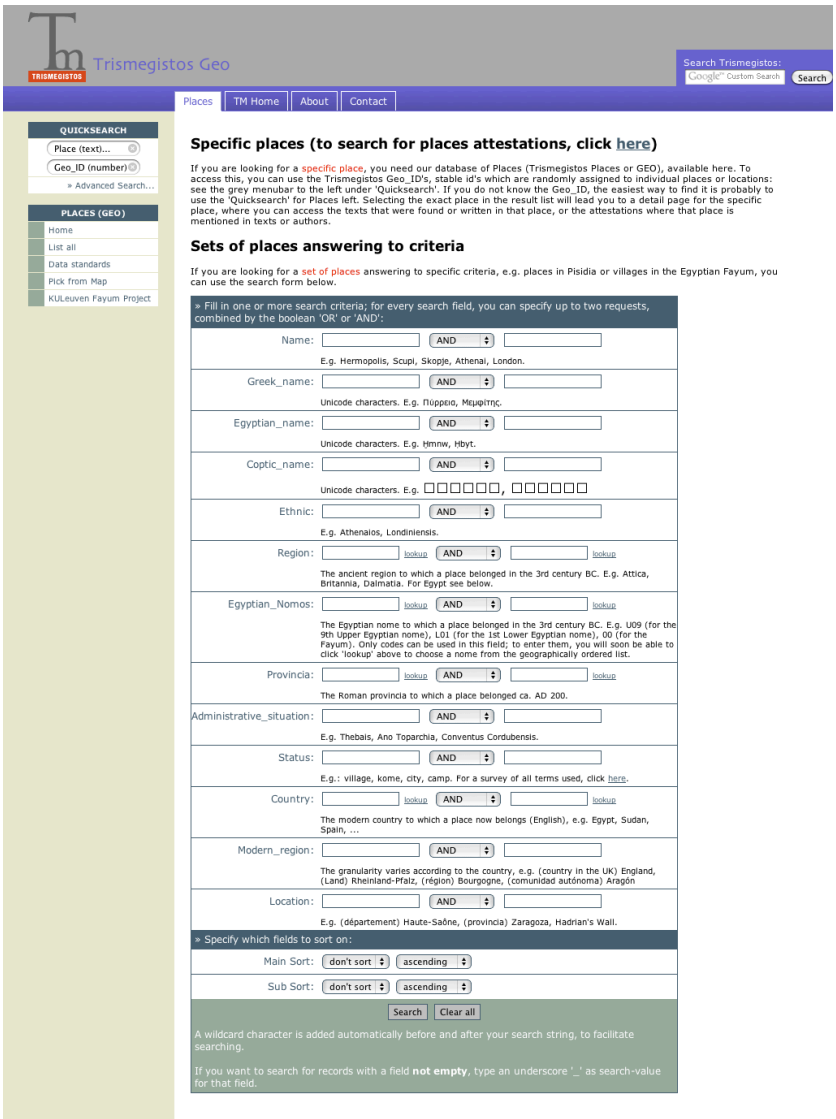

Figure 2.1: Trismegistos Geo Search

Every toponym in TM Geo is identified by a unique number. E.g. Roma = TM Geo 2058.

Figure 2.2: Rome Card in Trismegistos Geo

This number is linked to a set of geographical data: the ancient name of the place, the modern name, the modern country it belongs to, the ancient region (in the 3rd century BC), the Roman *Provincia* (in ca. 200 AD), the modern region (2.2) and a more precise location within a modern district or its distance towards a nearby town. e.g. TM Geo 20422:

- Latin name: Narbo
- modern name: Narbonne
- modern country: France
- ancient region: Gallia
- Roman provincia: Narbonensis
- modern region: Languedoc-Roussillon
- location: in the département Aude

Since not every set of data contains all the necessary information, work is still going on in order to complete the contents of the TM Geo cards.

It is important for searches that the spelling of the ancient toponyms is harmonized. Toponyms from the Greek east are transliterated into latin alphabet, but usually also a Latin spelling is added. E.g. standard name: Nikopolis, Latin variant: Nicopolis. Also other variant spellings have been be added.

2.2 General structure of Geographical information

The regional definitions belong to a long established use in the studies of antiquities. Due to the swift and fast changes in the administration and structure of the Roman Empire, not to speak of Greek cities and hellenistic Kingdoms, for the purpose of cataloguing, reference is often made to specific periods in which the administrative structure was particularly clear from the sources we have, and lasted long enough. This might be made much better and far more precise using LOD practices but would require a separate project due to the complexity of the scope, so the one presented here would be necessarily temporary best practice and a good ground to improve data in the future. Nevertheless in each bibliographical reference specific information on each item can be found.

Initially the following structure was shared and discussed in the working group as the regional organizational framework.

2.2.1 Ancient regions (3rd century BC)

- Acarnania
- Achaia
- Achaia Phthiotis
- Aemilia
- Aeolis
- Aethiopia
- Aetolia
- Africa
- Apulia
- Arabia
- Arcadia
- Argolis
- Armenia
- Arsinoites
- Attica
- Bactria
- Bithynia
- Boeotia
- Bosporus Cimmerius
- Britannia
- Bruttium
- Campania
- Cappadocia
- Caria
- Cataonia
- Cilicia
- Corsica
- Creta
- Cyclades
- Cyrenaica
- Dacia
- Eastern desert
- Elam
- Elis
- Epirus
- Etruria
- Euboea
- Galatia
- Gallia
- Germania (sc. east/north of the Rhine)
- Hibernia
- Hispania
- Illyricum
- Ionia
- Isauria
- Isthmos
- Italia
- Lower Egypt
- Laconia
- Latium
- Lemnos
- Lesbos
- Liguria
- Locris
- Lucania
- Lycaonia
- Lycia
- Lydia
- Macedonia
- Malis
- Marmarica
- Mauretania
- Media
- Mesopotamia
- Messenia
- Moesia
- Mysia
- Noricum
- Northern Sinai
- Numidia
- Paeonia
- Palestina
- Pamphylia
- Pannonia
- Paphlagonia
- Phocis

- Phoenicia
- Phrygia
- Picenum
- Pisidia
- Pontus
- Raetia
- Rhodos
- Samnium
- Sardinia
- Sarmatia
- Scythia
- Sicilia
- Sinai
- Sogdiana
- Sporades
- Syria
- Thasos
- Thessalia
- Thracia
- Transpadana
- Troas
- Upper Egypt
- Umbria
- Venetia
- Western coast
- Western desert

2.2.2 Roman provinciae (ca. AD 200)

- Achaia
- Aegyptus
- Africa Proconsularis
- Alpes Cottiae
- Alpes Graiae
- Alpes Maritimae
- Alpes Poeninae
- Aquitania
- Arabia
- Armenia
- Asia
- Baetica
- Belgica
- Bithynia et Pontus
- Britannia
- Cappadocia
- Cilicia
- Corsica
- Creta
- Cyprus
- Cyrenaica
- Dacia
- Dalmatia
- Epirus
- Galatia
- Germania Inferior
- Germania Superior
- Hispania Citerior
- Iudaea
- Lugdunensis
- Lusitania
- Lycia et Pamphylia
- Macedonia
- Mauretania Caesariensis
- Mauretania Tingitana
- Mesopotamia
- Moesia Inferior
- Moesia Superior
- Narbonensis
- Noricum
- Numidia
- Pannonia Inferior
- Pannonia Superior
- Raetia
- Sardinia
- Sicilia, Melita
- Syria
- Thracia

3

2.2.3 Italian regiones (from 41 BC)

- Aemilia (Regio VIII)
- Apulia et Calabria (Regio II)
- Bruttium et Lucania (Regio III)
- Etruria (Regio VII)
- Latium et Campania (Regio I)
- Liguria (Regio IX)
- Picenum (Regio V)
- Roma
- Samnium (Regio IV)
- Transpadana (Regio XI)
- Umbria (Regio VI)
- Venetia et Histria (Regio X)

2.2.4 Roma

- Regio I Latium et Campania
- Regio II Apulia et Calabria
- Regio III Bruttium et Lucania
- Regio IV Samnium
- Regio V Picenum
- Regio VI Umbria
- Regio VII Etruria
- Regio VIII Aemilia
- Regio IX Liguria
- Regio X Venetia et Histria
- Regio XI Transpadana

These are accepted denomination for all Content providers. The chronological limits implied in this are a choice due to the complexity which would need to be reflected for different earlier and later periods. For example, while the archaic world would need mostly a city by city organization with little and very localized broader territorial organization, on the other end of the chronological spectrum of antiquity, there are provinces and administrative divisions of the late antiquity which are subject to very frequent changes. The above articulation allows a good localization and a fair information.

2.3 Trismegistos Geo and Pelagios

In the Framework of a memorandum of understanding between the EAGLE BPN and the PELAGIOS 3 project,[4] the gazetteer of places in Trismegistos Places will be exported as OA[5] to join the Pelagios Network. This will involve an alignment between Pleiades and Trismegistos Geo, which will be probably done via Wikidata and will produce multiple identifiers for places. This result is a potential drawback in terms of our intended goal of producing unique identifiers; however we have differently defined identities and to keep them separated but linked is the path towards to richest possible linked ancient data network.[6]

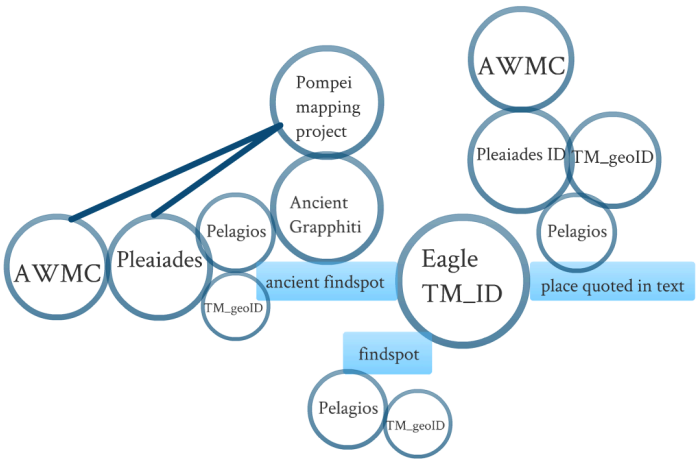

Figure 2.3: Linked Geo-IDs

[4]Many extremely interesting application related to this project can be seen in the blog http://pelagios-project.blogspot.de/

[5]http://www.openannotation.org/

[6]A similar case can be found in Stevenson 2012.

This is an affirmed and successful best practice, already implemented by some of EAGLE members and among world wide digital ancient world project. This again is a step towards making data available for Linked Open Data project and contributes towards the creation of the Web of Resources.

EAGLE/Trismegistos will host annotations relating to EAGLE partner's content. Pelagios 3 will makes annotations available through its Demonstrator API, so that also each EAGLE BPN partner and the EAGLE portal will be able to exploit with Pelagios 3 API and Widgets this data to enrich contents. Eagle portal will have Pelagios 3 widgets and the data will also be used for EAGLE mobile applications for image recognition and storytelling.

Trismegistos and Pelagios

To exploit the harmonization effort taken on this regard, we have prepared also tools that allow to enrich metadata directly before ingestion with URIs pointing to the Trismegistos cards. This harmonization tool is a XSL stylesheet which matches the contents which have been sent to Trismegistos with the data in the metadata record and is integrated with the other tools described below (see p.51).

As a last step in this field for harmonization we look forward to and endorse the practice of Europeana for Semantic enrichment.[7] Data about places will be enriched in EDM with links to four types of reference resources, including geoNames as envisaged also in the EAGLE Metadata Model (D3.1 2013) for places.

[7] Isaac, Clayphan, and Haslhofer 2012, p. 37

Key Best Practices Summary for this chapter

BP 3: Toponyms and identifiers Give each place a single card, which has a unique ID number (Pleaides and Trismegistos Geo are the two existing gazetteers for ancient places). This number should contain no information but be a stable reference. No reuse of IDs.

BP 4: Variant names Names shall be also in Latin alphabet transcription. Variant spellings or translations of the names shall always be preserved, for example in a specific field with some diacritics to facilitate searching by non-specialists.

BP 5: Spelling Harmonization Latin transliteration and spelling can be added in variant names to enhance the possibilities to find relevant results for users.

HE 1: Networking and related contents Open Annotation will be made for all toponyms to be part of larger places network, as the Pelagios Network. This allows connection with all other related resources via toponyms.

HT 1: XSLT for harmonization of places id and URI allows to insert TM Geo ID. When HE1 will be done with the ID it will be possible to see all possible related content from the numerous partners of Pleaides and Pelagios network.

Chapter 3

Vocabularies

3.1 Linked Open Data Vocabularies for Epigraphy

As Di Stefano Manzella [1] clearly explained classification is no easy issue in any field: epigraphy is no exception to this rule. Traditionally the CIL VI (Rome) classification has been used as a reference, as this typology has served as a model for all epigraphic production in the Roman Empire. There are nevertheless new glossaries and classification curated by CIL, which retain the limits of a formal classification, together with the benefits of this.

Problems are various, and include also the use of terms across vocabularies and the doubts which might be generated by archaeological chance. Piso 2001, pp. XI-XII for example noted:[2]

> Au vrai, l'ancienne école épigraphique s'est peu souciée du support archéologique des inscriptions et du contexte archéologique dans lequel elles étaient découvertes. Pour le support archéologique j'ai tenté chaque fois qu'il m'était possible d'en identifier la catégorie et la fonction. Puisqu'on tend, à juste titre, vers une histoire totale, il est important, par exemple, de savoir si telle plaque inscrite était encastrée dans la base d'une statue honorifique, dans un monument funéraire ou dans le mur d'un édifice quelonque. Il y a ensuite toute une série de monuments qui présentent les éléments d'un autel, notement le socle, le dé médien et le couronnement, mais sans en remplir le fonction. Dans ce cas c'est la fonction qui compte, et non pas l'aspect extérieur. Ce qui caractérise un autel, c'est le focus, tandis

[1] Manzella 1987, p. 109
[2] Following a current of studies which has its main in G. Susini and J.-N. Bonneville.

> que dans le couronnemente d'une base (piédestal) sont souvent pratiqués des orifices qui servent à fixer la statue. Pourtant, les deux éléments manquent souvent, car on peut toujour recourir à un focus mobile et, d'autre part, une statue peut se soutenir par son propre poids. En pareil cas, j'ai noté "autel ou base de statue".

Epigraphy is one of the disciplines for the study of History, for some it is not a discipline on its own. But for this same reason there is nothing that can be neglected and maximum precision is required. In the description of the object, for example, at least four kind of information should be looked at

- date
- function
- material
- state of preservation

Sometimes it is impossible to distinguish because:

- objects with different function might be identical when observed.
- an object type might depend on its function and viceversa

For example we can take two object which might be identified as one or the other or might not. Altars and statue base may appear identical to the observers, and the same object may be interpreted by different scholars as either one or the other. And yet they represent two distinct object types when one comes to classifications.

An altar is a monument which is self defined and it is used to make sacrifices and libations. The base of a statue instead is the support for a statue.

It will certainly be an altar if there is a *focus* for sacrifices or traces of it, but that can be missing: it could have also been made of metal or ceramic and therefore be movable. An altar would also be recognizable from a decoration with *pulvini* or a *patera* or a *urceus*. The text of the inscription can also be a way to define the monument type. On the other end we are certain that the monument is a Statue base if there are signs of the statue and where it was fixed to its base. But also in this case a statue could just stand because of its weight. This is also the case when we deal with techniques of execution of an inscription. Those can also be multiple and an inscription can be for example both a graffito and painted. For this reason in the metadata model these information are allowed for multiple times, but vocabularies do not define multiple terms. This is one best practice in the definition of vocabularies which is very important for the nature of contents at play. This is also the reason why the EAGLE BPN believes that it is best practice

to provide not just definitions of all main terms but also examples from different areas and in different state of preservation.

The Europeana LOD practice for metadata recommends the adoption of machine readable vocabularies. The WG has adopted Linked Open Data practices and approaches[3] to address the existing problems in classification and in publication of a machine readable vocabulary of values (controlled vocabulary).[4] LOD

Linked Open Data principles as stated by Berners-Lee (2006) are as follows:

1. Use URIs as names for things[5]
2. Use HTTP URIs so that people can look up those names
3. When someone looks up a URI, provide useful information, using the standards (RDF, SPARQL)[6]
4. Include links to other URIs, so that they can discover more things

The Working Group therefore looked for a tool which would allow direct RDF publication of the data.

TemaTres[7] was chosen from a series of available options open or commercial

VocBench a free software for publishing thesauri: http://aims.fao.org/tools

GINCO a thesaurus management software: http://data.culture.fr/

PoolParty a commercial software: http://www.poolparty.biz/test-demo/

TopBraid a commercial software: http://www.topquadrant.com/solutions/

iQvoc a commercial software: http://iqvoc.net/

This free Vocabulary Management system compared to the others offered a very high usability, export facilities which allow for SKOS, DC and several other standards, constant and active support from developers.

Compared against the above principles we have done the following to create a useful tool for networking and harmonization which could be based on currently used bet practices but also allow for further improvement:

1. each item of EAGLE vocabularies in TemaTres has a URI, also non preferred and target terms.

[3] Bizer, Heath, and Berners-Lee 2009

[4] Harper et al. 2012, pp. 4-5 for the definition. See also Isaac, Clayphan, and Haslhofer 2012

[5] Defined as *generic means to identify any entity that exists in the world.* Bizer, Heath, and Berners-Lee 2009

[6] *RDF provides a generic, graph-based data model with which to structure and link data that describes things in the world.* Bizer, Heath, and Berners-Lee 2009

[7] http://r020.com.ar/tematres/

2. all EAGLE vocabularies uris are HTTP.
3. upon acknowledgment of the requirements of existing users, we provide for each main term:
   - definition
   - bibliography
   - alternative terms
   - translations of terms
4. In the Eagle vocabularies there are URIs linking to several other vocabularies and more will be added as described below.

In facts the many problems and complexities which Manzella 1987 underlined and exposed can find a solution using the LOD approach.[8] Both the limits of choices and hierarchical organization can be bypassed using unique identifiers and relations among those. Poli-hierarchical structures as well as the presence of many possible denomination with specific and self standing definition allows for both precision, consistency, sustainability over time of this approach.[9]

For example, an inscription can easily be classified both as *magistrati populi romani* and as *decuriones municipales*; a document can be classed both under the fasti and under the individual. These major advantages can be exploited when the effort of publishing open machine readable material is undertaken and a document can be then classified chronologically and alphabetically without the need of an authorial choice.

Nevertheless, the major possible advantage is that there is no patent need, from a LOD approach, to distinguish among Greek and Latin inscriptions: they can find their place together in a Linked Data edition and benefit of other efforts in this direction (See section 6 page 61.).

3.1.1 Methodology

As for Metadata Vocabulary, also in the establishment of controlled vocabularies of terms the best practice is to minimize the creation and proliferation of vocabularies by harmonizing the existing ones and matching whenever possible.[10] The alignment had to take place first among the vocabularies in use, in the form of simple lists. These will be then matched to existing vocabularies. This mapping task requires a very broad expertise in the field and indeed some terms turned out to be problematic and are still under discussion. There is no problem in this and indeed it is an enrichment process, when tools that allow for this discussion

[8] World Wide Web Consortium 2012; Bizer, Heath, and Berners-Lee 2009
[9] Harpring 2010
[10] Harper et al. 2012, p. 7

and consequent changes are in place. Therefore we believe there is no effective and real vocabulary without a dynamic community behind it discussing its terms and maintaining it. Openness and availability alone are not enough. The WG supported this method as a best practice which further stakeholder could use for the alignment of medium sized heterogenous terminologies. A first draft has been then proposed to several mailing lists in the Digital Humanities field for comments and met a very positive welcome as a first extensive attempt to address a centuries long problem. This fully supports and exceeds what envisaged in the DOW(Description 2013, 10 part A) already at this first release:[11]

> Aim of this task is to provide guidelines and recommendations to ensure the continuous addition of qualitative and quantitative attractive content by the EAGLE BPN, including the definition of vocabularies and terminologies to be used to enrich and harmonize the content and the analysis of the tools and practices to adequately geo-reference it. Best practices will be identified on how to include in EAGLE metadata model the most suitable vocabularies and terminologies and how to harmonize the geo-referencing of the epigraphic content.

The same approach that the Pleiades and Pelagios project took for geographical data is adapted here to seven other possible ways of linking data for the international community.

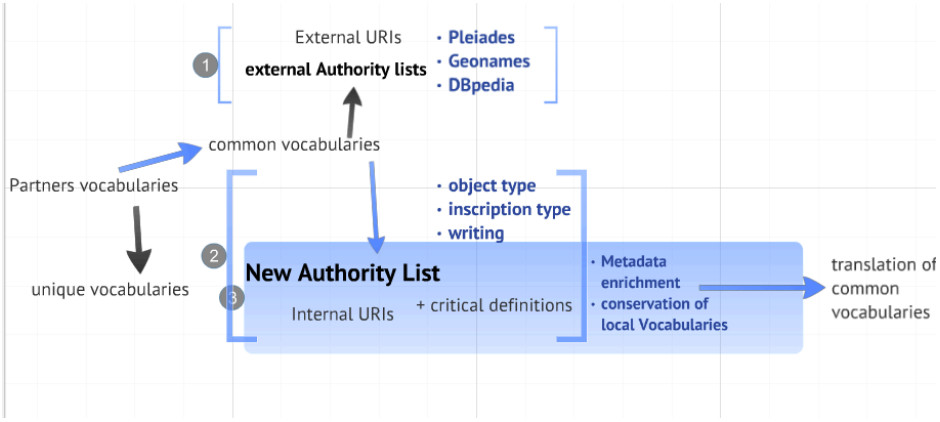

Figure 3.1: Schema for vocabularies decisions

[11] The all process of development of these vocabularies has been carried out together with the effort of definition of the metadata model (D3.1 2013) at all stages.

alignment

The alignment of the vocabularies was carried out using the following Google spreadsheets following on a previous international effort by the EpiDoc Community agreed during the first WG1 meeting. This allowed us to keep always track of relevant modification (e.g. new entry and related id), and to open up in an easy and familiar way to any interested party the contribution to the alignment. New partners can align their vocabularies in this tables before the actual publication in the EAGLE TemaTres Vocabularies takes place. It has also been a tool to guarantee multiple reviewing of data. The following are the spreadsheets in use:

Type of Inscription : `http://goo.gl/KHwTh`

Object type : `http://goo.gl/FL1wW`

Material : `http://goo.gl/EqeCD`

Writing : `http://goo.gl/cbRXd`

Decoration : `http://goo.gl/znT2C`

State of preservation : `http://goo.gl/GbqLB`

Dating Criteria : `http://goo.gl/W9Bge`

Red cells indicate yet unsolved problems at technical or alignment level. There are also comments on specific problems.

Bold entries indicates that the specific entry has a definition given by that Content Provider (in the column) which has been also reported in the TemaTres edition.

Where *multiple bold* entities are present a common definition is envisaged but for this first release the multiple definition present have been all added. In these cases the term in the normalized column is *underlined*.

Where *no bold entry* is present a definition needs to be entered. The red text indicates the chosen language and therefore the priority is given to the initial users of the term to provide a definition with examples and references.

Where simple relations could provide for a definition from a related term, *italic* is used in the Normalized text field.

A *red bold* entry denotes a text which has a definition which needs to be updated to meet the agreed Eagle standards.

To each of this, where it was available, also translations provided by the Epidoc Consortium where inserted as Translations (Non Preferred Terms). These tables where in use in the community and are based on the EDR vocabulary. All Greek, Arabic, Russian, Suomi and Turkish translations are taken from this resources, harmonized and integrated in the TemaTres version.

In the case of Object Type also an effort to provide always a latin translation has been carried out by the subgroup working on this vocabulary.

In each vocabulary you will now find a *URI* column and a *Normalized entry* (with capital letters).

The following are the principles used to chose a main term among the aligned ones, its related terms and terms in target vocabularies.

1. On occurrence of aligned terms, the language more attested was used, or, preferably, the one term which *has a definition*.
2. Where there are conflicting options the English is chosen and where no English is available the Latin.
3. Where only attested in one vocabulary, the original language of that vocabulary is chosen.
4. Terms in the main language of a vocabulary which were not chosen as a main term are stored as a *Target Vocabulary* term of the main chosen one.
5. Any translation of terms, once for each language, is inserted as a *Non Preferred Term*.

3.1.2 Content Enrichment with Tematres

Content Enrichment

Content enrichment has been more conveniently done with the use of the aligned vocabulary only in TemaTres.[12] Among the advantages of TemaTres there is the possibility to expand the search from the bottons in the bottom right corner which perform searches of the term being viewed in the main Google search engines.

We entered only one term in one language for each of the aligned terms as there suggested. Due to a limit in language encoding of the chosen software, we also decide not to input terms written in the same way in different languages, if not in the case of Target Vocabularies.

Most entries still need examples and bibliography, which will be our tasks in the second and third year of the project for the second release of this Deliverable. Instead of inserting images in the Tematres vocabulary a link in the description is provided to existing examples of that term in use in the databases of the Consortium. For this release, due to an export problem of the software these links where not exported. This problem will be solved for the second release, in occasion of which at least one example for each main term will be provided.

In a second data curation phase we have then added language specifications for each term, directly in the SKOS file together with all specific terms.

[12] See D2.1 2013, 26f.

      </skos:closeMatch>
   </skos:Concept>
```

Each term acquired in Tematres a URI in this form
`http://www.eagle-network.eu/voc/typeins/lod/113`

where the part after "voc" is the name of the vocabulary and the number is a unique reference into the specific vocabulary. This is NOT the consecutive number in each letter alphabetic list. The decision to build uris with the vocabulary name as well, is dictated by the presence of the same term in different vocabularies.

The above link will point to the TemaTres resource, while the following
`http://www.eagle-network.eu/voc/typeins/skos/113`

will lead directly to the raw SKOS version of the same. The SKOS/RDF files exported from tematres and curated with language and some further useful data can be found in the following open repository (see p.56):
https://github.com/PietroLiuzzo/epidocupconversion/tree/master/allinone

The following are the uri of the *EAGLE vocabularies in Tematres*:

- http://www.eagle-network.eu/voc/typeins/
- http://www.eagle-network.eu/voc/objtyp/
- http://www.eagle-network.eu/voc/material/
- http://www.eagle-network.eu/voc/writing/
- http://www.eagle-network.eu/voc/decor/
- http://www.eagle-network.eu/voc/statepreserv/
- http://www.eagle-network.eu/voc/dates/

Among the latest improvement to the vocabularies Hungarian has just been added and Portuguese translations are on their way for most terms. Among next steps that the group working on these has set, there is also the one to align with the

Getty Art and Archaeology Thesaurus, and English Heritage vocabularies, while we expect data enrichment about date to be done at the EDM aggregation stage with an alignment to the Semium time ontology and DBpedia.

While the choice of a flat kind of vocabulary is the best and most flexible in most cases, in two of the EAGLE Vocabularies we have opted for a hierarchical structure: Material (3.3) and Dating Criteria (3.7).

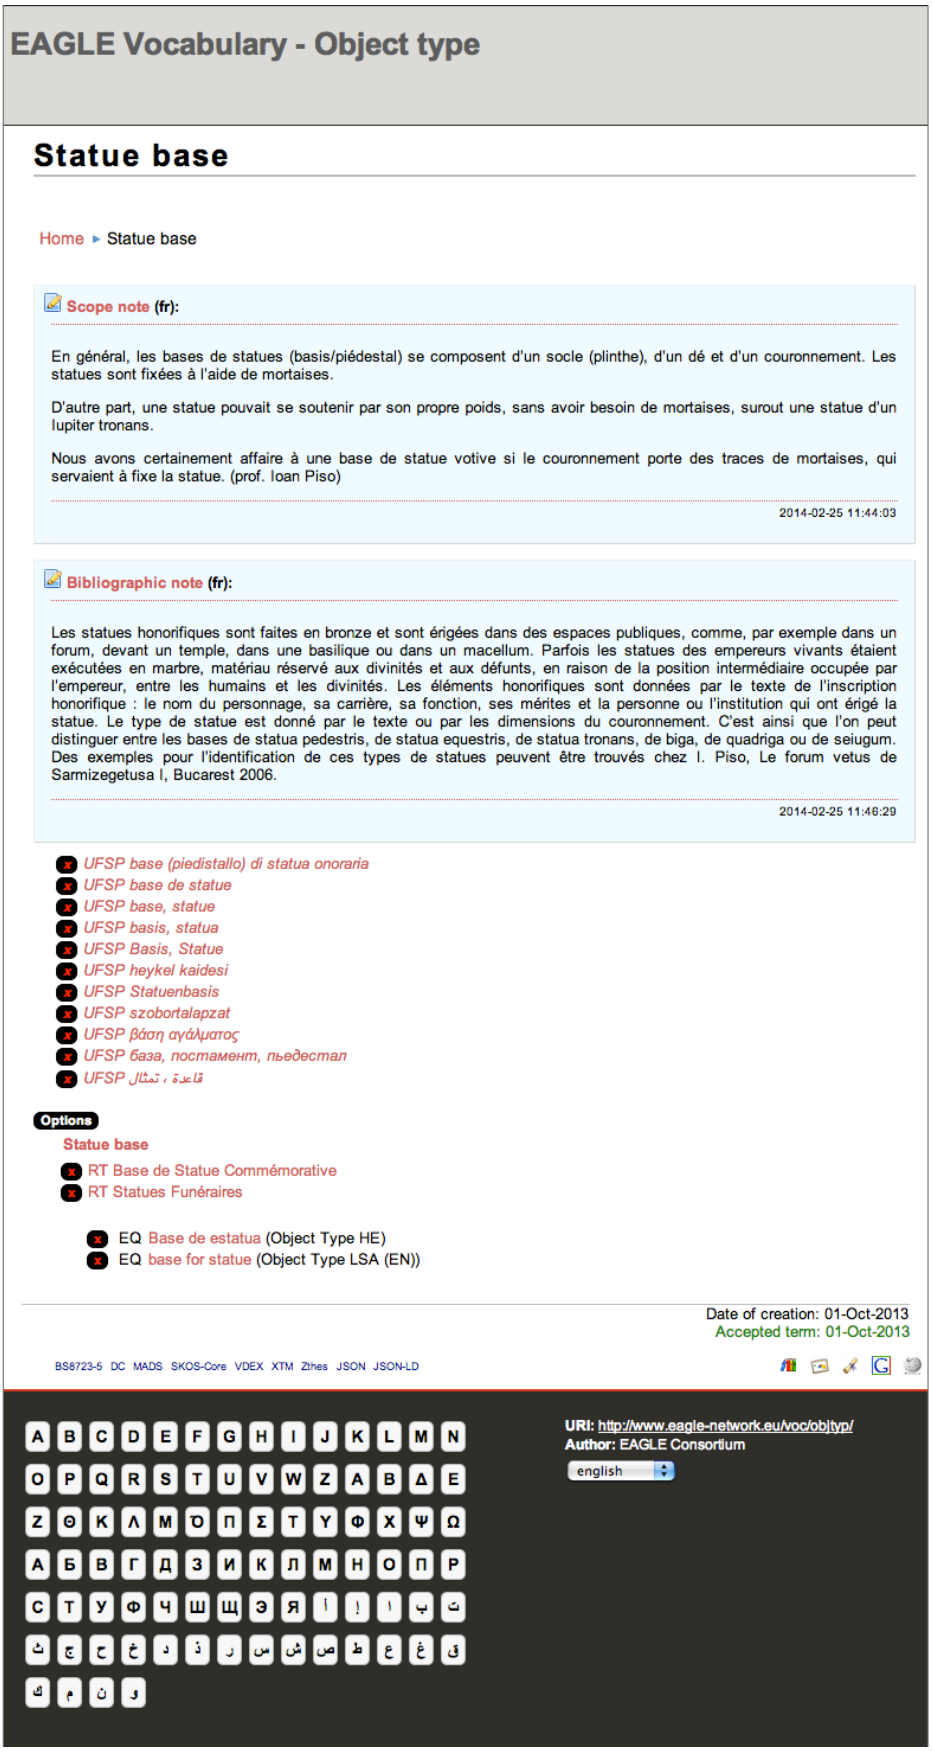

Figure 3.4: Statue Base

Key Best Practices Summary for this chapter

BP 6: LOD Each vocabulary entry shall:

- **a** be related to existing resources
- **b** be a dereferenceable resource with an identifier in the form of an http url.
- **c** have links to with other entries
- **d** have links to external vocabularies
- **e** have links to external resources using the term consistently
- **f** be exposed and accessible for access, export, editing, reuse

BP 7: Harmonization Minimize the creation and proliferation of vocabularies by harmonizing the existing ones.

BP 8: Multilingualism Attested terms in any language shall be preferred values compared to one to one translations of terminologies as such.

BP 9: Open Software Use open software to allow iterability, high possibilities of interaction as well as flexibility to adapt to different needs.

HE 2: Vocabularies alignment Comparison of terms and definition is a task requiring constant activity, continuous interaction and networking.

HE 3: Definitions each vocabulary term should have definition(s), bibliography and examples.

HE 4: Relations each vocabulary term should be related in meaningful ways to its subordinate terms, broader terms, parallel terms and external representations.

HT 2: The EAGLE Vocabularies the TemaTres vocabularies developed provide a tool for harmonizing data without impact on local practices. Stakeholders have already demonstrated direct interest in this effort which has perspective comparable to those of geographical data.

HT 3: XSLT for harmonization of vocabularies id and URI allows to insert TemaTres URI in XML files, when the value in use is present in those, seamlessly.

3.2 Type of Inscription

3.2.1 Key Data

In this vocabulary (6.2) are described all terms which concern the type of text written on a stone according to its function and aim as a text. (Manzella 1987, pp. 110-111)

Table 3.1: EAGLE Vocabulary - Type of Inscription / EAGLE Consortium

3.3 Object Type

3.3.1 Key Data

The classification of objects (6.2) on which an inscription can be written is extremely complex in many cases. For example, within the scope of the inscription which would fall under Statue Base, there are few cases in which what survives is an 'Inscribed plaque' – an inscription once affixed to a base (made of a different material) – and in other cases our 'statue base' in a wider context would more naturally be defined in another way: in particular 'Triumphal arch' (say, for the Arch of Constantine, that once supported statues), 'City gate' (like those of Rome, with statues of the emperors), or 'Columnar monument' (e.g. Trajan's Column – which of course supported a statue).

Table 3.2: EAGLE Vocabulary - Object type / EAGLE Consortium

3.4 Material

3.4.1 Key Data

This hierarchic Vocabulary (6.2)relies on the definitions of the Simplified Petrography in Salzburg. Another classification can be found inCIL Material Glossar. No Definitions can therefore be found here.[13] Most of the Alternative Terms in Bulgarian, Turkish, Croatian, Suomi, Arabic and Modern Greek come from the Epidoc Consortium efforts, as described in the general introduction (3).

The vocabulary is hierarchically designed to allow for both precise and generic definition, as well as for several types of uncertainty. In many cases, for example for precious/exotic materials (onyx, gold, etc.) precision is possible and desirable but for most banal materials only basic distinctions will generally be possible. In many cases scholars in epigraphy do not seek to decided whether a base was of Proconnesian or Thasian marble, nor to decide exactly what kind of stone the local material was (generally a form of limestone), in such cases, the best practice is to allow for different levels and choices.

A result of this approach has also been that this vocabulary should also be a complete list of possible material on which an inscription from antiquity can be found.

Many problems are involved with this kind of classification as well. "Arcilla" for example is not in the same "class" as "terracotta, inscribed brick, etc", because it pertains to the material in which the inscription was written or carved in, that is, like "stone, metal or wood". There are also specific terms which could be assimilated but are not, like "Lumaquela", the local name for the stone in which most of the inscriptions from Tarraco were carved in.

Table 3.4: EAGLE Vocabulary - Writing / EAGLE Consortium

This vocabulary (6.2) collects all writing techniques and types as attested in the EAGLE BPN. A major classification problem is faced on this respect by epigraphists. In same cases the distinction between the method used to produced a text is used as a principle for a definition, in some other the name of the writing technique is based on the result obtained, no matter of the method that was used. In particular *Punctim*, *litt. Scariphatis* and *litt. Eminentibus* are defintions of this second type. A first distinction that should be made when defining a writing technique should be whether

- the text has been obtained by adding material.
- the text has been obtained subtracting material.
- the text has been obtained modifying the material (as in cases of impression with a matrix which does not always involve subtraction of material)

Subtractive Techniques include texts which have been engraved, chiselled or graffiti. In these cases part of the surface of the material is removed to obtain the inscription. The following techniques among the one in the vocabulary would fit this definition:

- scalpro
- stylo
- digito
- terebro
- caelo
- a stecca

Additional Techniques include all those instances in which a different material is added on a base surface of the inscription. The following techniques among the one in the vocabulary would fit this definition:

- penicillo
- calamo
- carbone
- crustis
- tessellis
- litt. applicitis ex lamina vel ex brattea

There are indeed techniques which mix this two macro-types:

- litt. alveolatis
- litt. Ageminatis

Impression Techniques involve soft or still soft materials and do not fit in any of the previous two categories. material might be removed but this is not the rule and does not by itself determine the inscription. The same type can be used for those inscriptions which are obtained by fusion or liquefaction of a material in a mold, as this is a particular type of modification of a material. The following techniques among the one in the vocabulary would fit this definition:

- impression techniques
  - signaculo
  - typo
  - signaculo candente (impression with heath)
- techniques with a matrix
  - ex forma

There are writing techniques which do not fit any of the previous categories suggested.

Classification should also take into consideration the material on which they are applied which can for this classification purpose be hard or soft. In this cases in fact the technique is different not because of the method used but because of the particular status of the support in the moment in which the inscription was produced.

There are also inscriptions on ceramic which use the technique "scalpro" with capital letters imitating those of lapidary inscriptions. Scalpro would tehrefore be fine for these rare examples as well.

hard	**soft**
atramento	Crustis
caelo	litteris ex forma
carbone	Signaculo
litteris ageminatis	Stilo
litteris alveolatis	Tessellis
litteris applicitis	
litteris eminentis	
litteris ex cartha aurea	
litteris scariphatis	
pictura	
punctim	
scalpro	
terebro	
typo	

3.6 Decoration

3.6.1 Key Data

Terms in this vocabulary (6.2) describe any decoration surrounding an inscription. *Hederae*, *crosses*, and *chi-rho* monograms are probably among the most frequent decorations, but there are a number of classifiable features of decoration which support and are indeed vital in some cases, to the understanding of the inscribed text. Many artistic calssification could be suggested, but for the purposes of epigraphic research we offer a flat list of features which can be found surrounding an inscription.

Table 3.5: EAGLE Vocabulary - Decoration / EAGLE Consortium

3.7 State of Preservation

3.7.1 Key Data

State of preservation (which could probably be abbreviated to ‘Condition’, 6.2) is a small vocabulary describing the general condition in which the inscription is at the moment of the latest inspection. In many cases we won’t know if an inscription still exists.

3.8 Dating Criteria

3.8.1 Key Data

The common use among Members of the BPN is to insert, when this information is available two dates (6.2). A ‘Not before’ and ‘Not after’ dates. this is still a best practice and should definitely be preserved in any encoding. There are nevertheless divergences on historical periods and indeed in the way computations are done. In many cases only a generic date is possible. In this vocabulary we suggest a series of standardizations which equate some locution with a specific date interval, e.g. "shortly after" with an interval of ca. 10 years. The WG has chosen to always explicitly suggest the corresponding TEI origDate element as a definition in this vocabulary. Within the TEI element it is also possible to express uncertainty and probability of dates.

Chapter 4

Harmonization of contents

4.1 Translations

The situation of these type of data was and still is that of a large series of very small, but high quality corpora. There are high numbers of translations of inscriptions out there, but very very scattered and this has been the first real attempt to gather them all in one place. The EAGLE MediaWiki is, to our knowledge, the biggest existing database of translations of inscriptions as well as the first ever attempt to use Wikibase outside of Wikidata.

History and development

EAGLE BPN and Wikimedia Italia, subcontractor in the project have set up a Mediawiki (*The EAGLE Mediawiki*) which collects translations of inscriptions.

With Wikimedia Italia we have mapped some data from Content Providers of the EAGLE BPN, both original members and newly affiliated members. Some also still in the process of signing an affiliation agreement.

We uploaded automatically a subset of metadata including all available URI and text of the translations. We have added other known URIs to increase the ability to browse the Mediawiki.

Wikibase

After briefly considering *Semantic MediaWiki* as a way forward we have opted for *Wikibase*, although there where no precedents, as this would allow direct LOD export in RDF automatically, in line with other decisions within the EAGLE BPN and guidelines supported by Europeana.

Wikibase enabled us to import and export as well as to directly edit the Eagle Media Wiki as it is an open database online software and is also wiki-synthax free. To support individual addition to the database a tutorial has been developed.[1]

The following images are a sample record from the inscriptions of Brigetio and the main page of the wikibase.

Wikimedia Commons and EAGLE

Please, note the property "*Image(s)*": in this property a direct link to WC can be found. The photo from Wikimedia Commons is inserted and linked to the transla-

[1] See p.423.

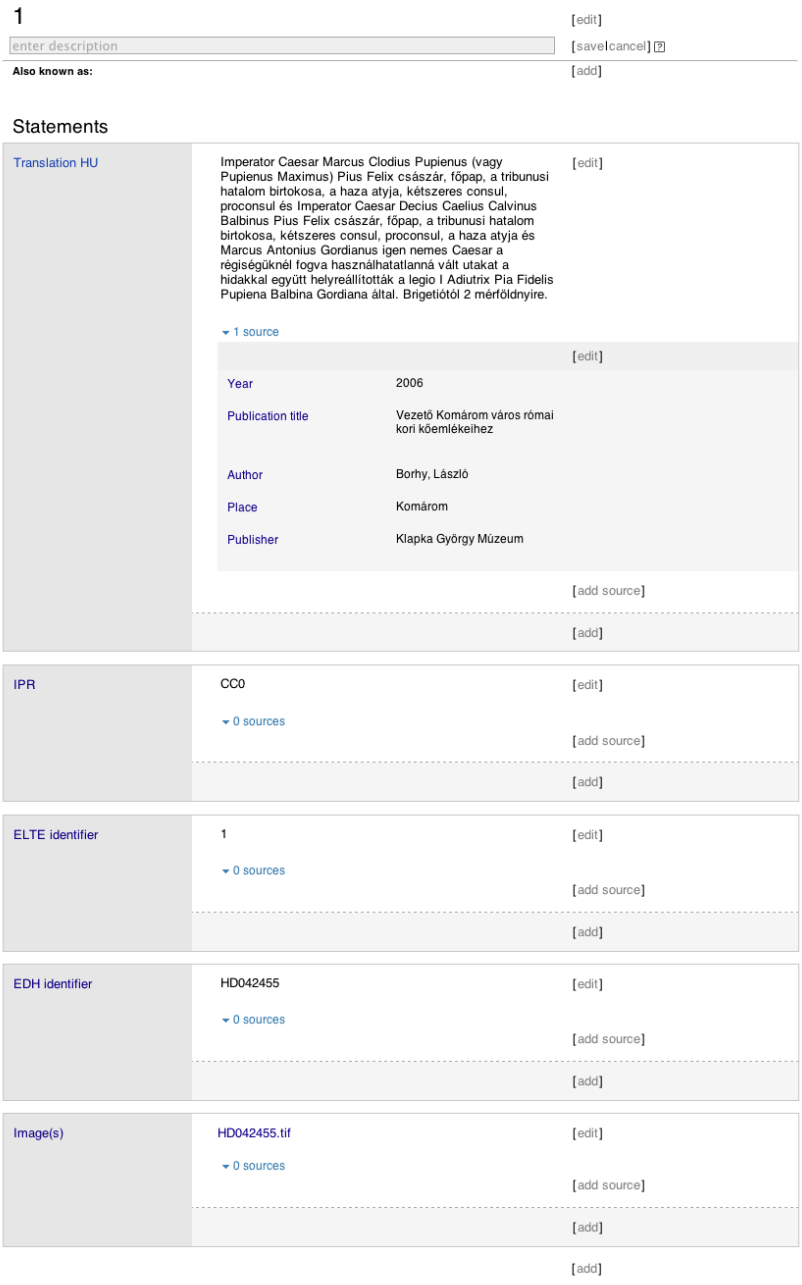

Figure 4.1: Brigetio 1

tions of the inscription as easily as by entering the name of the file. This has been a major benefit for us in the use of Wikibase, which really allow us to easily link

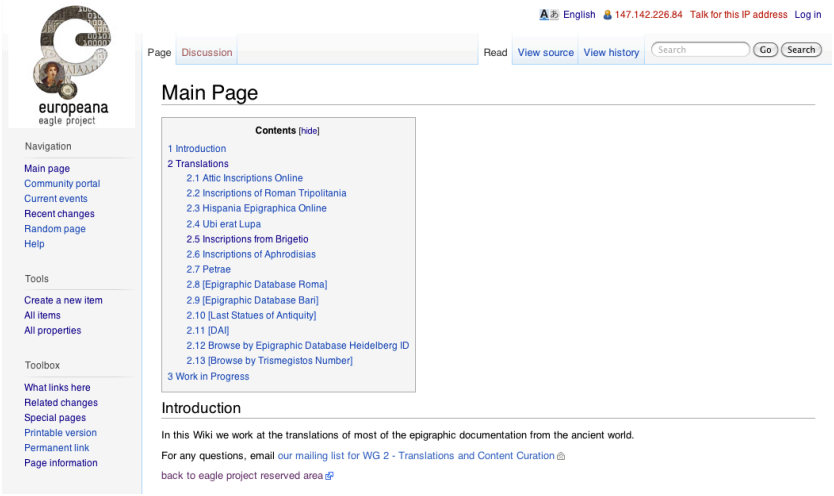

Figure 4.2: The Eagle Media Wiki

resources in WC, in the EAGLE BPN databases and in other projects. The last but not less important benefit of this is the ability to enter several translations (in the same or in different languages).

We did face some problems, related to the nature of the contents: not always the same inscription is considered as such by all editors, neither there is always agreement on integration of the text and consequently on how the translation should be.

The flexibility of the Wikibase software has been vital to all the stages of the process. The enterprise has been highly successful till now. We hope it will carry on at an healthy rate with more and more data being linked and entered.

Our next steps, while we continue to add materials from small and medium corpora of translations of inscriptions will be: Next steps

- to engage user groups in entering translations directly in Wikibase
- to engage users to connect WC resources to meaningful categories and to the EAGLE BPN metadata
- to ensure quality by implementing an interaction with Perseids (see following section, p.61), the new project of Perseus Digital Library, which uses SoSOL (Son of the Suda On Line) to filter entered corrections and new entry via an editorial board before publication. (on the cooperation between EAGLE and Perseus, see http://www.eagle-network.eu/new-cooperation-between-eagle-and-perseus-digital-library/)
- to ease further the insertion of links to images on commons by exploiting the presence of unique identifiers both in WC and in EMW.

- explore the possibilities offered by GLAM-toolkit.

4.2 Bibliography with Zotero

There are in the EAGLE BPN several curated and structured bibliographies. As a next step in content harmonization, not yet implemented but foreseen at an initial stage for the second release of this document, there is the harmonization of this bibliography.

The Working Group suggested as a best practice one that would meet the needs of the user community. This group of users needs quick and precise reference to publications for direct use in articles and other publications developed with popular WYSIWYG word processors. Moreover the bibliography needs to be a research tool reliable and updated.

The Working Group suggested therefore the use of a group in Zotero. This will entail the import of dumps from main bibliographies and a de-duplication process for bibliographic references. The Group has been created and is here:[2]

EAGLE Epigraphic Bibliography

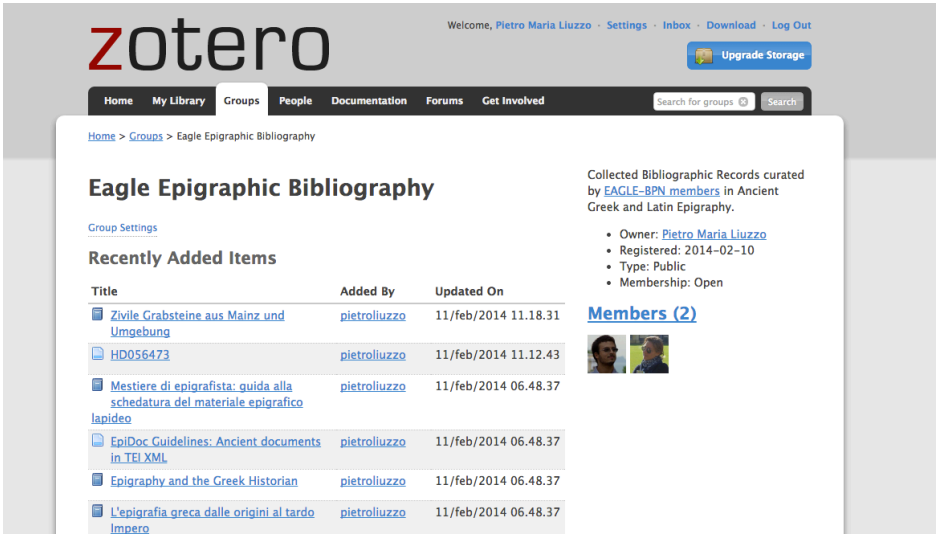

Figure 4.3: Eagle Epigraphic Bibliography (Zotero Group)

Some important benefits of this software for the users can be

[2]Another group in Zotero which provides an example of best practice is the EpiDig Group. there are also an existing Epigraphy Group and Linked Open Data Zotero Bibliography.

- free and open-source license
- easy import and export
- one-click metadata and full text imported from major sites storing bibliographic information such as (JSTOR, Google Scholar, AMAZON etc.).
- facilitated editing and online and offline usability and syncing
- integration with the most popular word processors. Drag and drop functions.
- export and print in many different bibliographic styles both citations and bibliography

On the other side also the bibliographic databases benefit from this effort

- more exposition of the bibliographic database,
- integration and enrichment with other databases
- multiplication of export formats (bibtex, bookmarks, mods, rdf, xml, etc)
- easier organization of contents of the bibliography with tags and folders
- multiple input and quick additions of items

Especially on import, references can be moved from the database in many formats (see:How to import in Zotero), whereas some tools as EndNote need a multiple steps procedure (see: EndNote in Zotero).

This task will also allow for large communities of users in academic institutions worldwide to be engaged in the effort of bibliography harmonization in the domain of ancient epigraphy. There has been a long felt need for a structured common reference bibliography available online. With the use of the resources offered by Zotero in future projects and developments it might also be possible to archive relations between bibliographic entries and therefore highly enrich the quality of research possibilities.

Zotero pros and cons

Nevertheless, some unsolved issues must also be noted:

stable keys/handle/uri each item receives a URL when it is imported into Zotero; based on our reading of the documentation in the user forum, this url is supposed to be stable.[3] However, the url is not intended to be a unique and universal key for each singular publication (e.g. for a specific book), but of course a unique reference in that personal or group bibliography. So for example this is the same record in a personal bibliography and in the general group is different

- itemKey/FXJQAB3Z

[3] https://forums.zotero.org/discussion/13090/record-id/

- itemKey/7CUVAQ9J

morover, these urls are recreated if you happen to update the same record with a batch upload (see Zotero - record id).

The workaround mentioned in the forums is the same other bibliography management systems use: insert your own disambiguated and unique handle/key in an "extra" field. In this way the info contained in the record is preserved (by users, not by Zotero).

cardinality of fields with urls to inscriptions This is not possible in one record. On one side this would be a "citation VS reference" problem (working definitions can be found below). On the other there is also a question of granularity. Zotero allows for a relation option, which would also be bibliographically meaningful (see: Relations in Zotero). This means, that if we make one record for each inscription as an online publication we can then have one record for the publication it is in and as many relations as we want. Here again there is a problem although: these relations are not visible online neither exported in any export format, but they can be visualized if one has downloaded the plugin or standalone and in reports (which can be customized, se reports). A relation cannot be created in the web service. Faolan C.P., Zotero Administrator, in a recent support forum post wrote:

> I don't believe this was possible at the time of the first post. It now is, and is generally planned but I'm not certain when it will land.[4]

Eagle status

The situation of the EAGLE consortium is such that some databases have a citation only system (e.g.EDR), some have both citations and a reference bibliography, but not connected among them (e.g. EDH), some only have a reference bibliography (e.g. DAI). Moreover, on the citation level there is on one side the greatest heterogeneity, on the other there is an almost complete effort of standardization done by Trismegistos in the task for de-duplication of items.

This complex situation is indeed of some benefit when trying to establish a best practice as the cases at play represent most of the possible situations and a solution to be found for this will be with more probability useful for future stakeholders.

Work-definitions

The following are initial guidelines for this sub-task in content curation and harmonization.

By **Citations** we mean abbreviated forms of bibliographical information to give direct reference, identification and basic information on an item.

By **References** we mean the list of full bibliographic records to which usually citation point.

[4] https://forums.zotero.org/discussion/22534/zotero-web-interface-showing-related/

Best practice for a commons Epigraphic bibliography therefore include sets of suggestions for both citation and references and efforts of harmonization from the existing situations which can also allow for further and consistent expansion and long term sustainability.

- On the side of citations the aim is to have a stable reference, possibly a URI, to be used as a pointer and identifier.
- On the side of reference completeness is the key guideline, together with structure and relations according to the Working Group.
- Again these are points which perfectly fit a LOD approach which can use RDF in XML for example.

Given a commons bibliography with URI for each item in proper and evident relation to other items, each provider should use, seamlessly to the local format of citations, these URIs to enrich the code. This requires a minimal structuring of bibliographic information such as to divide the given data in single units.

Bibliographical alignment is indeed a very complex issue and will need to be carefully thought about and addressed in the following years of the EAGLE project.

Key Best Practices Summary for this chapter

BP2: Interaction and Networking Joining GLAM and other major efforts in the Wikimedia context allows for internal and external interaction as well as for a very high impact on users and facilitation to engage them.

BP 6: LOD Also for translations and bibliography "LOD ready" tools should be used not only for external possible connections to happen but also for more specific internal tasks as linking structured bibliographical data and building a common full citation-reference system.

BP 8: Multilingualism Dealing with translations the more languages available, the better. Also to have more translations in one language, makes them comparable and consequently the quality of data much higher.

BP 10: Usability Wikibase offers the easiest available way to write structured RDF triples with no need to know anything about RDF or triples.

BP 11: Shared online bibliography Although several published and curated bibliography exist, best results for interaction and engagement of users in data enrichment can be reached only with online tools.

HE 5: collecting translations scattered data need to be first of all collected from sources:

- **a** published (in a Zotero library)
- **b** unpublished
- **c** already online

HT 4: Eagle Wikibase this tool allows for perfect integration with Wikimedia Foundation projects: Wikimedia Commons, Wikidata, Wikipedia as the main examples.

Chapter 5

Standards and tools for data harmonization

5.1 Epidoc as Harmonization format for inscriptions

The main harmonization guideline adopted is to align the XML format of data provided for aggregation and ingestion, to the TEI specification EpiDoc. This well established standard, broadly used in many high quality projects,[1] allows for a very easy alignment, for the production of an XML file compliant with international standards and for high flexibility for integration of the vocabularies and places gazetteer in use.[2]

> EpiDoc is an international, collaborative effort that provides guidelines and tools for encoding scholarly and educational editions of ancient documents. It uses a subset of the Text Encoding Initiative's standard for the representation of texts in digital form and was developed initially for the publication of digital editions of ancient inscriptions (e.g. Inscriptions of Aphrodisias, Vindolanda Tablets). Its domain has expanded to include the publication of papyri and manuscripts (e.g. Papyri.info). It addresses not only the transcription and editorial treatment of texts themselves, but also the history and materiality of

[1] See: https://sourceforge.net/p/epidoc/wiki/Home/ and http://wiki.digitalclassicist.org/Category:Projects. Among these especially King's College projects as the Inscriptions of Aphrodisias and the Inscriptions of Roman Tripolitania.

[2] Please, note that this is one of two standards adopted in the Eagle Metadata Model. D3.1 2013, Part II, 2.1

> the objects on which the texts appear (i.e., manuscripts, monuments, tablets, papyri, and other text-bearing objects).[3]

In the Gentle Introduction all steps taken towards this are explained and clarify the historical reasons for which this standard among others is the one preferable for epigraphers.

> Over the last century, epigraphers have wrestled with the issues involved in representing non-verbal information within their written texts. Until the end of the 19th century publishers could be expected to produce a facsimile of the text, but this became decreasingly common, and publishers did not demonstrate a parallel willingness to provide a full photographic record of every text. The conventions which have been painfully developed to indicate missing text, abbreviations, etc. have been more or less generally agreed since the 1930s and overlap, to some extent, with those used in papyrology and palaeography. All epigraphers have had to deal with the issues involved in moving this to an electronic environment - for example, finding a font which will permit underdotting; but most of us have now adjusted to these new constraints. [...] The need for agreed standards is not limited to epigraphy. Since 1987 an international consortium of scholars principally in the humanities has been working together to develop and refine a set of guidelines for describing the structure and content of documents. The results of this endeavour have produced an encoding language, realized in XML and described by the name of the group - TEI, the Text Encoding Initiatve.[4]

5.2 Upconversion to Epidoc

In cooperation with UHEI tools have been developed to support the alignment and harmonization of data from content providers to international standards for what concerns digital editions of inscriptions.

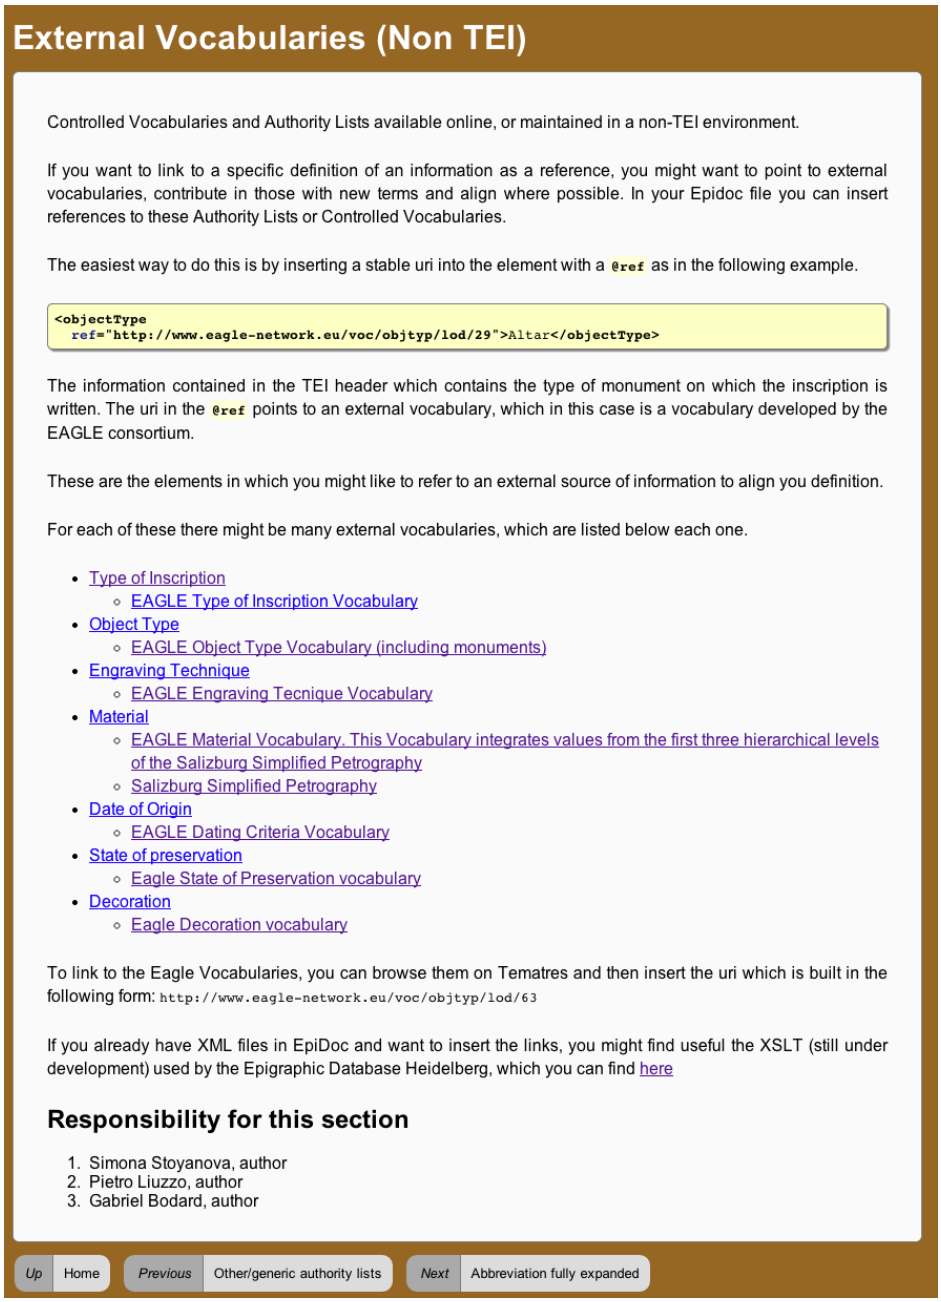
This is all freely available also for potential new partners in the Git repository.

All references in the .xsl are absolute, in order to guarantee reusability.

XSLT for EPIDOC

Given the template described in Part III, and ANNEX II of the EAGLE Metadata Schema (D3.1 2013), the following XSLT convert from string epigraphic texts in marked up TEI-EPIDOC XML, following the EpiDoc guidelines (Elliott et al. 2007).

[3] https://sourceforge.net/p/epidoc/wiki/Home/
[4] http://www.stoa.org/epidoc/gl/dev/intro-eps.html



External Vocabularies (Non TEI)

Controlled Vocabularies and Authority Lists available online, or maintained in a non-TEI environment.

If you want to link to a specific definition of an information as a reference, you might want to point to external vocabularies, contribute in those with new terms and align where possible. In your Epidoc file you can insert references to these Authority Lists or Controlled Vocabularies.

The easiest way to do this is by inserting a stable uri into the element with a `@ref` as in the following example.

```
<objectType
  ref="http://www.eagle-network.eu/voc/objtyp/lod/29">Altar</objectType>
```

The information contained in the TEI header which contains the type of monument on which the inscription is written. The uri in the `@ref` points to an external vocabulary, which in this case is a vocabulary developed by the EAGLE consortium.

These are the elements in which you might like to refer to an external source of information to align you definition.

For each of these there might be many external vocabularies, which are listed below each one.

- Type of Inscription
  - EAGLE Type of Inscription Vocabulary
- Object Type
  - EAGLE Object Type Vocabulary (including monuments)
- Engraving Technique
  - EAGLE Engraving Tecnique Vocabulary
- Material
  - EAGLE Material Vocabulary. This Vocabulary integrates values from the first three hierarchical levels of the Salizburg Simplified Petrography
  - Salizburg Simplified Petrography
- Date of Origin
  - EAGLE Dating Criteria Vocabulary
- State of preservation
  - Eagle State of Preservation vocabulary
- Decoration
  - Eagle Decoration vocabulary

To link to the Eagle Vocabularies, you can browse them on Tematres and then insert the uri which is built in the following form: `http://www.eagle-network.eu/voc/objtyp/lod/63`

If you already have XML files in EpiDoc and want to insert the links, you might find useful the XSLT (still under development) used by the Epigraphic Database Heidelberg, which you can find here

Up Home | Previous Other/generic authority lists | Next Abbreviation fully expanded

Figure 5.1: Epidoc Guidelines

These are a series of XSLT based on Chetc.txt (by Hugh Cayless, Elli Mylonas, Gabriel Bodard and Tom Elliott) and further support from the Epidoc Collaborative

(especially from Gabriel Bodard) which:[5]

1. allows to convert epigraphic texts with various encoding and conventions from string to Epidoc markup and valid against the The EpiDoc RelaxNG schema.
2. Populate appropriate elements with available common URI from the vocabularies
   - http://www.eagle-network.eu/voc/typeins/ (3.2)
   - http://www.eagle-network.eu/voc/objtyp/ (3.3)
   - http://www.eagle-network.eu/voc/material/ (3.4)
   - http://www.eagle-network.eu/voc/writing/ (3.5)
   - http://www.eagle-network.eu/voc/decor/ (3.6)
   - http://www.eagle-network.eu/voc/statepreserv/ (3.7)
   - http://www.eagle-network.eu/voc/dates/ (3.8)
3. build a title for contents which do not have it, using descriptive data.

5.2.1 Step 1

One set of XSLT to serve different needs

Each project uses different conventions and therefore the regular expressions used to match particular situations are different. The two currently developed initial XSL are `edh-epidoc.xsl` and `he-epidoc.xsl`.

This are the same, unless for the fact that call appropriated `.xsl`

Each XSLT is applicable to any file is in the main directory, if it is a valid xml utf-8 file. The string text needs to be

- escaped if it is not
- normalized if it needs so

The process of mark up of the string text in div[@type="edition"] is accomplished in several steps to guarantee consistency and precision.

The `textstructure.xsl` looks for marker of different sections and tokenize them to apply the same .xsl to each section of the text which needs to be contained

[5]The following xsl will be maintained aligned with the Epidoc guidelines at all stages guaranteeing an effort free alignment to these international conventions for partners who can continue to apply local conventions for editing.

by an <ab> element. If there is only one part it applies following instructions to that only.

Each section of text is then processed by the `brackets.xsl`. Normalizing brackets is important for the following steps and splits individual semantic values. The notation [ort 3], which would mean that a supplied text is followed by a gap of three letters, is divided into [ort][3].

The normalized string which results from this process is then passed to the `upconversion.xsl` which works using the a specific operation to search for regular expressions patterns (`xsl:analyze-string`) and substitute them with correct xml elements.

The following is an example in which the pattern <E=F> is matched and substituted

```
<xsl:analyze-string select="." regex="(&lt;)(.)=(.)(&gt;)">
  <xsl:matching-substring>
   <choice>
     <corr>
       <xsl:value-of select="regex-group(2)"/>
     </corr>
     <sic>
       <xsl:value-of select="regex-group(3)"/>
     </sic>
   </choice>
</xsl:matching-substring>
```

The result will be

```
<choice><corr>E</corr><sic>F</sic></choice>
```

The result of this template is then passed to a further template which gives consistent numbers (`insertnumbers.xsl`). Empty lines do not need to have numbers, so Xpath is used to evaluate where to put a 0 as value of the @n in the <lb> element.

Starting from this

------] / e[t?] Q(---) Bl(a)e[sus?] / contub/ernalis / eius / d(e) s(uo) l(ibens) l(aetus) d(edit)

The result of this processes is then the following

```
<ab>
<lb n="0"/><gap reason="lost" extent="unknown" unit="line"/>
<lb n="1"/>e<supplied reason="lost" cert="low">t</supplied>
<abbr>Q</abbr>
Bl<expan><ex>a</ex><abbr>e</abbr></expan><supplied
```

```
    reason="lost" cert="low">sus</supplied>
<lb n="2"/>contub
<lb break="no" n="3"/>ernalis
<lb n="4"/>eius
<lb n="5"/><expan><abbr>d</abbr><ex>e</ex></expan>
<expan><abbr>s</abbr><ex>uo</ex></expan>
<expan><abbr>l</abbr><ex>ibens</ex></expan>
<expan><abbr>l</abbr><ex>aetus</ex></expan>
<expan><abbr>d</abbr><ex>edit</ex></expan>
</ab>
```

5.2.2 Step 2

On the following elements

```
<objectType>Stele</objectType>

<material>Marmor</material>

<term>Weihinschrift</term>

<origDate
  notBefore-custom="0001"
  notAfter-custom="0100"
  datingMethod="http://en.wikipedia.org/
  wiki/Julian_calendar">I cent</origDate>

<rs type="execution">engraviert</rs>

<rs type="statpreserv">incomplete</rs>

<rs type="decoration">hedera</rs>
```

populate the metadata with the vocabulary

A series of xsl, one for each vocabulary related to that element is called to match the content of the element with the vocabulary entry into an export of the *TemaTres* vocabulary stored on git and regularly updated.

Each entry with non preferred and target vocabulary entries looks like the following

```
<skos:Concept rdf:about="http://www.eagle-network.eu/voc/typeins/lod/73">
      <skos:prefLabel xml:lang="en">Akklamation</skos:prefLabel>
      <skos:altLabel xml:lang="en">Acclamation</skos:altLabel>
      <skos:altLabel xml:lang="en">Aclamación</skos:altLabel>
      <skos:scopeNote xml:lang="de"> Ausrufe; Anrufungen.
      Wahlslogans, Glkwsche, Sinnsprhe. Nicht
         bei Defixio oder Anrufungen an Gott (s.Gebet). </skos:scopeNote>
      <skos:historyNote xml:lang="en">Examples: vivas;
      spes in Deo salvo episcopo Marciano
         HD008112 HD018228</skos:historyNote>
      <skos:inScheme rdf:resource="http://www.eagle-network.eu/voc/typeins/"/>
      <skos:related rdf:resource="http://www.eagle-network.eu/voc/typeins/lod/75"/>
      <skos:related rdf:resource="http://www.eagle-network.eu/voc/typeins/lod/74"/>
      <skos:exactMatch>
         <skos:Concept rdf:about="http://www.eagle-network.eu/voc/typeins/lod/243">
```

```
        <skos:prefLabel xml:lang="it">Acclamatio</skos:prefLabel>
      </skos:Concept>
    </skos:exactMatch>
    <dct:created>2013-08-01 12:27:53</dct:created>
    <dct:modified>2013-08-20 14:17:18</dct:modified>
  </skos:Concept>
```

so the xsl looks for matchings in `skos:prefLabel` and in `skos:altLabel` and then reports in a @ref the URI of the parent `skos:Concept`, to give the following result:

```
<objectType ref="http://www.eagle-network.eu/voc/objtyp/lod/250">Stele</objectType>
<material ref="http://www.eagle-network.eu/voc/material/lod/48">Marmor</material>
<term ref="http://www.eagle-network.eu/voc/typeins/lod/80">Weihinschrift</term>
<origDate
notBefore-custom="0001"
notAfter-custom="0100"
datingMethod="http://en.wikipedia.org/wiki/Julian_calendar"
period="http://www.eagle-network.eu/voc/dates/lod/92">I cent</origDate>
<rs type="execution" ref="http://www.eagle-network.eu/voc/writing/lod/3">engraviert</rs>
<rs type="statpreserv" ref="http://www.eagle-network.eu/voc/statepreserv/lod/5">incomplete</rs>
<rs type="decoration" ref="http://www.eagle-network.eu/voc/decor/lod/155">hedera</rs>
```

5.2.3 Step 3

To populate the element <title> with meaningful information the `maketitle.xsl` checks the content of the file and looks for Type of Inscription and Object type. If both information are present the form of the title will be “inscription on object” if only one of the two is present that either of them will be used. It might happen that none is know. In that case the xsl looks for the CIL or AE bibliographic reference. Only in the unlikely event that there is none of this information the title “Inscription” is given.

This XML file does not appear to have any style information associated with it. The document tree is shown below.

```

```

Figure 5.2: Eagle Epidoc export with harmonization XSLs

5.2.4 Simplified Workflow

A simplified workflow for data curation is a necessary best practice to guarantee that technical knowledge is not an obstacle to the production of high data quality.

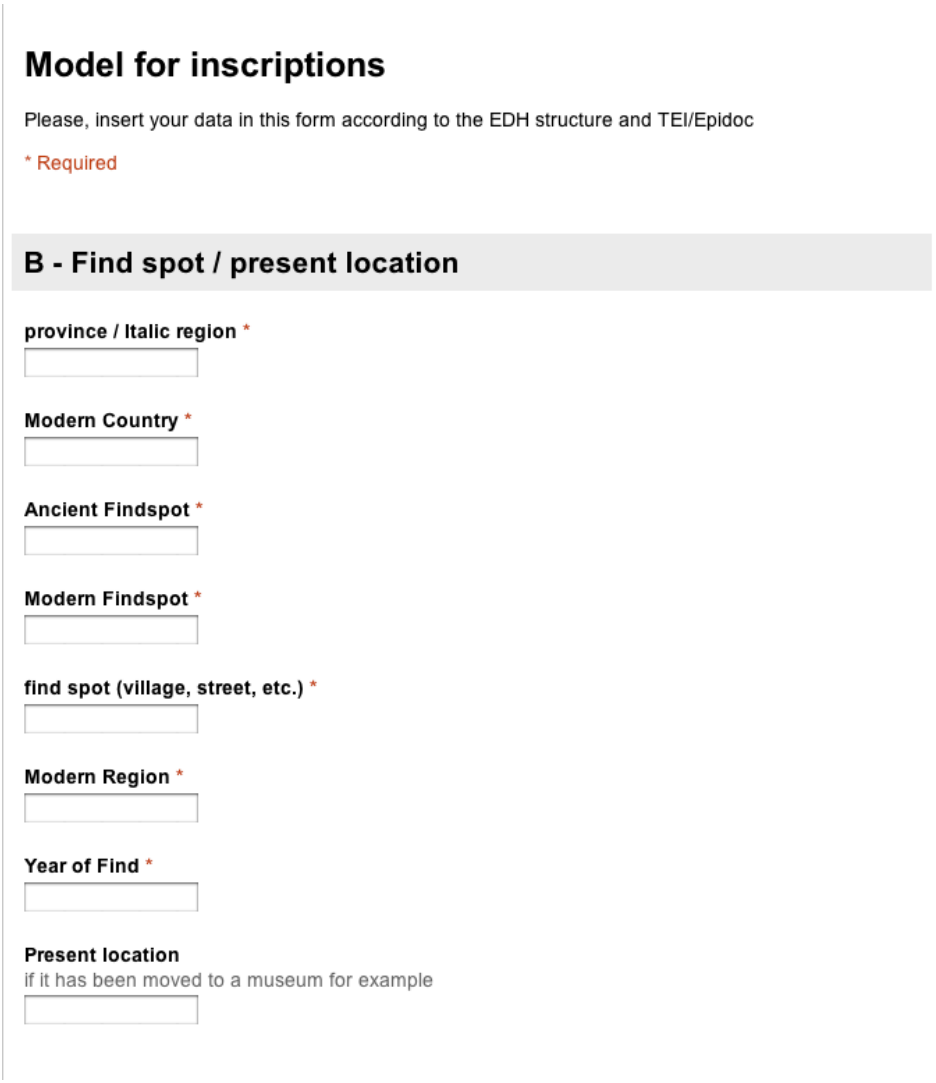

Figure 5.3: Epidoc data entry from google Drive

We have tested few options and decided within the WG to use well known software and develop transformation support. Data is entered in a google form that returns results in HTML. An xsl transformation which takes into account all the previous ones is set in place to transform those data (inserted according to strict principles) into the same EpiDoc format as from the exports and according to the Eagle Metadata Model Specification.

Key Best Practices Summary for this chapter

BP 2: Interaction and Networking Constant and useful cooperation has to be carried out with communities both digital and non digital.

BP 12: Raw data online All code and reference data should be available as raw data or via API.

BP 13: Automatization and curation No export should be delivered unchecked: exporting in different format should be an occasion for further consistency check towards cleanness of data.

BP 14: Semantically meaningful data No random flat XML should be produced if it is possible to produce tools that elaborate results according to meaningful standards.

BP 15: Openly accessible XSL XSL and generally useful code should always be openly accessible for reuse, for example in GitHub, together with updated versions of content related code, as vocabularies for reuse and data exploitation.

HE 6: Conversion and Crosswalking tools should be elaborated so that bidirectional transformations are possible.

HE 7: Simplification of workflow for external stakeholders it is essential that workflow is simplified, both by using well known tools and to guarantee that the user experience is satisfactory and not frustrating.

Chapter 6

Harmonization and interaction with international projects

6.1 Parnerships and interactions with international projects

As stated one of the key best practices for content harmonization is to seek maximum interaction with partner projects.[1]

6.1.1 Epidoc Community

The interaction with the Epidoc Community has been continuous for the development of the metadata model which is based on Epidoc as initial content to the establishment of vocabularies which are now contained also in the Epidoc Guidelines[2].

6.1.2 Perseus

The partnership with the Perseus project involves the development of interaction tools between the Eagle Media wiki of translation and Perseids.

The Perseids project is opening up the Perseus texts for user corrections, contributions and annotations, both in the classroom and

[1] The list of affiliated and cooperating partner attracted by EAGLE can be seen here: http://www.eagle-network.eu/about/get-involved/

EpiDoc Guidelines: Ancient documents in TEI XML

EpiDoc is an international, collaborative effort that provides guidelines and tools for encoding scholarly and educational editions of ancient documents. These are the *Guidelines* produced by the collaborative. In addition, the EpiDoc Website provides access to all the tools and collaboration environments supported by the collaborative.

EpiDoc uses a subset of the Text Encoding Initiative's standard for the representation of texts in digital form using the Extensible Markup Language (XML), a technical standard promulgated by the World-Wide Web Consortium. It addresses not only the transcription and editorial preparation of the texts themselves, but also the the history and materiality of the objects on which the texts appear.

These *Guidelines* contain descriptions of the textual, descriptive, and other features that are often expressed with EpiDoc, as well as the TEI elements and attributes that are used to encode them. The links below provide a number of entry points into the full document and should be thought of more as a series of thematic indexes into the content of the *Guidelines*, rather than a single "table of contents" that reflects an ordered, hierarchical document structure.

Browse Guidelines

- Introduction to the Guidelines
- Overview of EpiDoc structure

Full listing of guidelines pages:

- Descriptive and historical data
- Text transcription
- Vocabularies and indexing terms

Externally maintained guidelines for specialized communities:

- EpiDoc Cheatsheet (used in internal and external training)
- Papyri.info EpiDoc/Leiden+ help and examples
- Telamon EpiDoc Guidelines (Bulgarian)
- Digital Fragmenta Historicum Graecorum encoding guidelines (Monica Berti et al., Leipzig)

Correspondences between EpiDoc and other community guidelines:

- Text transcription and supporting material following PETRAE
- Text transcription following DDbDP
- Descriptive data following APIS
- Text transcription following Krummrey-Panciera 1980
- Text transcription following Panciera 1991
- Descriptive data following HGV

Figure 6.1: Eagle Vocabularies in the Epidoc Guidelines

out. Work submitted through Perseids will make its way back into the Perseus library (slowly now, more quickly later).[3]

In fact the work done in Perseids project answers perfectly to the needs of the consortium who stated concern about the quality of content inserted by online unknown users and which in this way could be controlled while producing metadata

[3]See also http://sites.tufts.edu/perseusupdates/, quote from the Memorandum of Understanding between EAGLE and Perseids.

already in XML.

6.1.3 Pelagios

> *Pelagios 3 is a Linked Open Data initiative, in which independent online resources are linked together by annotating common references to places (currently ancient Greek and Rome, but soon to be expanded) as defined in a URI-based gazetteer. These annotations can then be aggregated either by member projects or third parties for a variety of purposes, including search, contextualisation and visualisation.*[4]

Working with the data provided by all the consortium to KULeuven for aggregation in Trismegistos Geo, to produce annotations in OA Data Model will make possible the tasks described in section 2.3.

To give an example of this annotation, things would look similar to this:

```
<http://edh-www.adw.uni-heidelberg.de/edh/inschrift/HD004306> a pelagios:AnnotatedThing ;
 dcterms:title "Inschrift HD004306 (or any other suitable title for this item" ;
 <www.trismegistos.org/place/1163> a oa:Annotation ;
 oac:hasTarget <http://edh-www.adw.uni-heidelberg.de/edh/inschrift/HD004306> ;
 oa:annotatedAt "2013-11-12";
 oa:annotatedBy "Trismegistos";
 oa:hasBody [ cnt:chars "Korinthos" ; a pelagios:Toponym ] ;
 oa:hasBody <http://pleiades.stoa.org/places/570182#this> ;
 oa:hasBody <http://www.trismegistos.org/place/1163> ;
```

6.1.4 Europeana API

In order to achieve the best possible harmonization we have been in touch with the team working at Europeana API to get as many inscriptions already in Europeana as possible to enrich and harmonize them all also at stages before the aggregation.

[4] http://pelagios-project.blogspot.de/p/about-pelagios.html

6.2 Content Curation and Harmonization in Wikimedia Commons

In order to give a complete effort of harmonization, already existing and editable sources of information as Wikimedia Commons can be curated. Adding relevant information and links to metadata of images is a best practice to perform content curation and encourage quality content, enriching those data with the ones coming from local experts which can give scientific input to the available content.

There are in facts many categorized and organized photographs in Wikimedia Commons with no link to a scholarly online edition of the text. It is a best practice according to the WG to exploit existing effort and provide contributions in order to harmonize it and correct it were possible to meet research quality standards.

There is in Wikimedia Commons this picture for example:

https://commons.wikimedia.org/wiki/File:Mausoleu_de_Favara_2.jpg it corresponds to nr. 12143 in HEpOl

What we want to do is edit the metadata to make them like the one in this example: with a link to a database and correct categories.

https://commons.wikimedia.org/wiki/File:HD011512_1.tif

The summary section, might look like this:

```
{{Information
|Description=
{{ca|Mausoleu de Favara. Favara de Matarranya, Saragossa}}
{{en|Favara mausoleum. Favara, Saragossa}}
{{es|1=Mauseloe romano de Fábara (Zaragoza), correspondiente con las inscripciones romanas:
* Frontón: CIL II, 5851 = HEp. 8, 566a = AE 2000, 777a: D(is) M(anibus) / L(uci) Aemili Lupi
* Friso (puntos de anclaje de letras de bronce): HEp 08, 566 = AE 2000, 777b}}
|Source={{Own}}
|Date=2003-04
|Author= [[User:Baldiri|Baldiri]]
}}
```

In this case we simply add the url of the inscription in HEpOl, for example like this:

```
{{Information
|Description=
{{ca|Mausoleu de Favara. Favara de Matarranya, Saragossa}}
{{en|Favara mausoleum. Favara, Saragossa}}
{{es|1=Mauseloe romano de Fábara (Zaragoza), correspondiente con las inscripciones romanas:
* [http://eda-bea.es/pub/record... ...12143 Hispania Epigraphica Online]
* Frontón: CIL II, 5851 = HEp. 8, 566a = AE 2000, 777a: D(is) M(anibus) / L(uci) Aemili Lupi
* Friso (puntos de anclaje de letras de bronce): HEp 08, 566 = AE 2000, 777b}}
|Source={{Own}}
|Date=2003-04
|Author= [[User:Baldiri|Baldiri]]
}}
```

The EAGLE BPN will also take the effort of checking for obvious mistakes, but unless they are patent, they will not be corrected; the wrong information will simply

Size of this preview: 531 × 599 pixels. Other resolutions: 213 × 240 pixels | 425 × 480 pixels | 532 × 600 pixels | 680 × 768 pixels | 907 × 1,024 pixels | 2,435 × 2,748 pixels.

be commented out. The provided link will indeed by itself provide those who will want to know further precise information.

The EAGLE BPN decided to take some effort to organize also categories as a best practice for content harmonization.

In the above example there are all the ones we want.

```
[[Category:CIL II 005851]]
[[Category:AE 2000, 0777a]]
[[Category:AE 2000, 0777b]]
```

There are many photos in Wikimedia Commons that have no such category, as in this example.

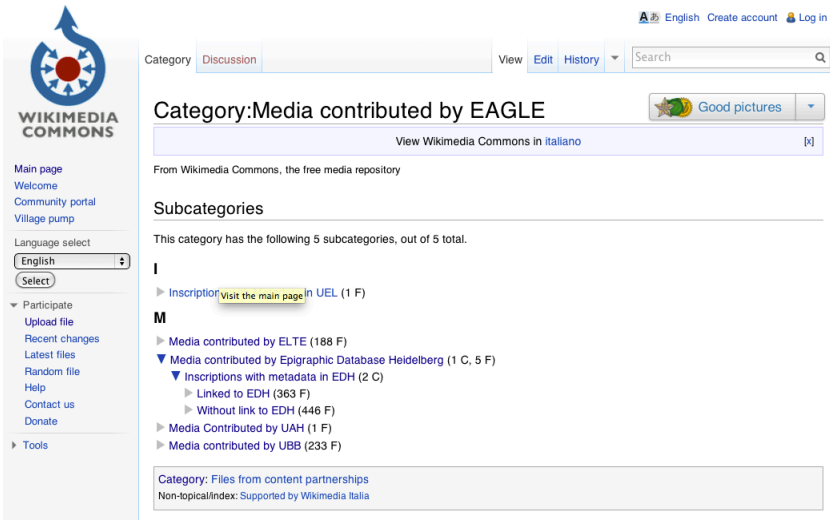

Figure 6.3: Media contributed by EAGLE - Categories

Figure 6.4: Categories for publication identifiers

We will add consistently categories which refer to CIL, AE and the EAGLE BPN member who contributed the file in case it is a file originally uploaded by one of the EAGLE Members.

If a required Category does not exist yet it will be created and properly placed under an existing Category.

- **Italiano:** Il Corpus Inscriptionum Latinarum (CIL) è una collezione di antiche iscrizioni in latino. Si pone come fonte autorevole di documentazione epigrafica relativa ai territori compresi nell'Impero Romano. Il CIL, come viene comunemente denominato, raccoglie le iscrizioni latine sino alla caduta dell'impero di Roma, di qualsiasi natura (pubblica, sacra, sepolcrale, onoraria, rupestre, graffiti etc.), e su ogni supporto epigrafico (per lo più pietra e bronzo) tranne che su papiro.

Key Best Practices Summary for this chapter

BP 16: Synchronization with other major projects It is always beneficial to understand what interaction there can be and to evaluate where it is better to build on existing resources instead of running parallel projects.

HE 8: Metadata Curation Given the existing efforts by users of Wikimedia Commons we believe that it is best practice to contribute to a common effort, unrelated to project's lifetime in order not only to give accessible content better quality but also to enhance.

Table 4 -- continued from previous page

Term	Type	Annotations	Lang
	definition	Si riferisce alle scritte realizzate a punzone ossia mediante l'uso di un punzone su materiale duro imprimendo un colpo con un mazzuolo o strumento similare. I marchi sono realizzati con signacula di vario materiale e dimensioni (alcuni hanno anche supposto l'uso di lettere mobili) recanti lettere rilevate o cave e quindi eviterei scalpro, mentre per quelli tracciati a "mano libera", come su alcuni tipi di lucerne o di anfore, userei stilo. Per le scritte realizzate usando le dita userei digito (nella bibliografia specifica, specie anglosassone, si trova spesso il termine litterae digitatae). Eviterei in quest'ultimo caso di usare stilo. Per quel che riguarda il vetro, oltre alle iscrizioni ex forma, le iscrizioni cosiddette graffite erano realizzate con strumenti molto simili a quelli impiegati per le gemme, in particolare si ricavava dapprima un solco con il trapano corrente e poi lo si allargava con un bulino. Per quanto riguara la lamina d'oro impiegherei il termine ex brattea aurea, dato che brattea è il termine tecnico che indica proprio le sottilissime lamine d'oro impiegate non solo nei vetri ma anche nell'oreficeria	**it**

Using Tematres: a Tutorial

Tematres tutorial

October 1, 2013

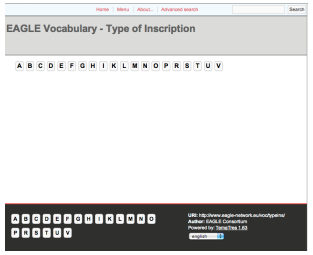
1 Structure

Eagle Vocabularies can be found at
http://www.eagle-network.eu/about/reserved-area/eagle-vocabulary/.
This document is intended to provide you with an easy tutorial on how to use Tematres to edit definitions and add informations to our common vocabularies.

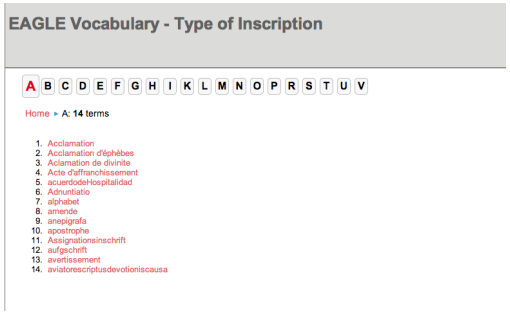
Figure 7: Tematres Tutorial

Click on EAGLE Vocabularies to get to the following page

By clicking on each vocabulary you should be able to open a page which looks like this



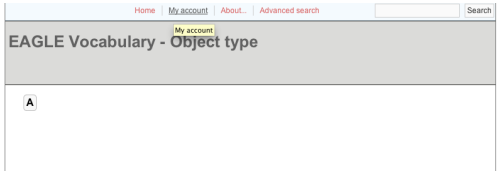
Clicking on each letter you will get, where terms have been imported already, to an alphabetic list like the following



At the top of the page, you can find Menus where to log in and access general options.

Figure 8: Tematres Tutorial

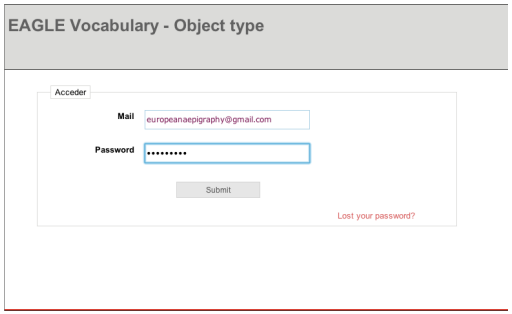
To Login, click on MY ACCOUNT



end enter

mail: **europeanaepigraphy@gmail.com**

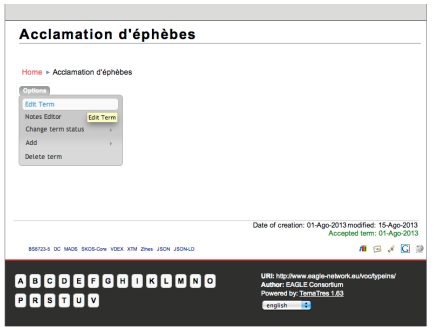
password: **epigraphy**



If you wish to have a personal account on your email, please ask Pietro or Claudio to set it for you.

2 Add Terms

The MENU menu has also a direct ADD TERM option. To Add terms, you can either use the menu above or enter new ones editing an existing term. Click on one term and the page of that one will appear. If there is an existing term you can click on OPTIONS and edit it as a term (this will not alter the URI, fortunately).



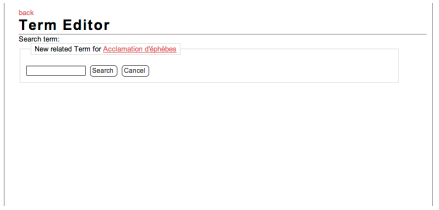


Figure 9: Tematres Tutorial

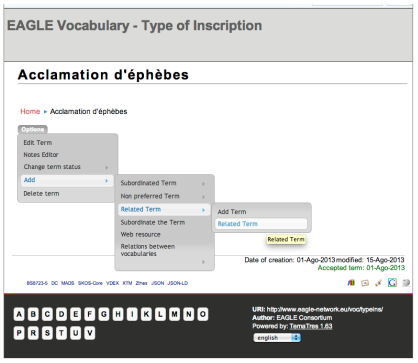
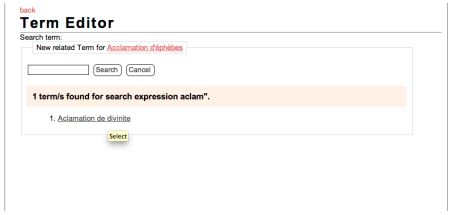
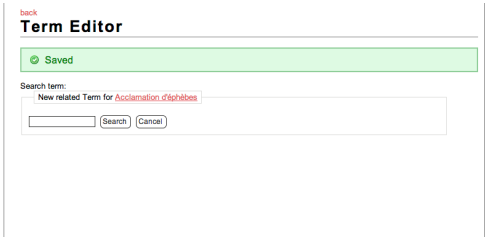
The same happens when entering a *related term*.



Following the path in the image above will open a page, where you can chose an existing term and add it.



Once you have searched and selected a term, you have to save this relation as shown below.



One option to provide specific definition if this is unnecessary is to provide useful relations. This system would provide a more correct relational definition than a hierarchical definition which could lead to forced structuring.

Inserting one relation will automatically produce both entries to have this relation stated.

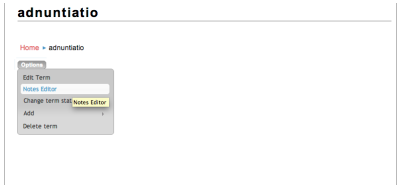
Hierarchical organization should only be used where this is necessary, as in the Material Vocabulary.

The same principle will be applied for alternative terms in the various vocabularies stating a specific kind of relation.

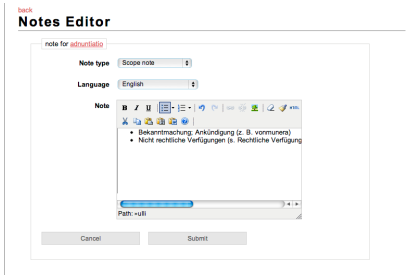
Figure 10: Tematres Tutorial

3 Edit Notes

From the option menu you can edit terms adding notes. This will serve for us the need to insert references, definitions and examples.

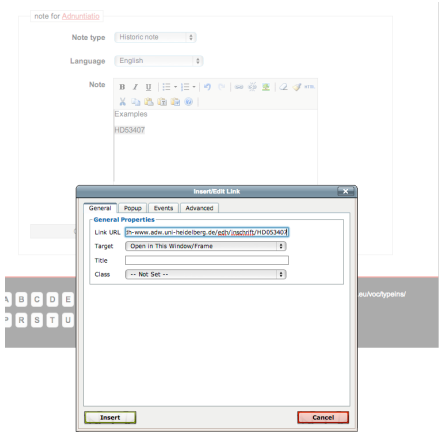


The note editor is very easy to use, is just as you can see below

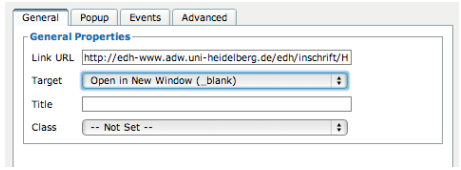


To insert a Definition, select SCOPE NOTE, the language of the definition and the text of it. Examples could instead be inserted as an HISTORIC NOTE. It would be advisable to insert examples in the form of links to existing materials.

This can be done by inserting the text, selecting and giving a url.



Always select OPEN IN NEW WINDOW

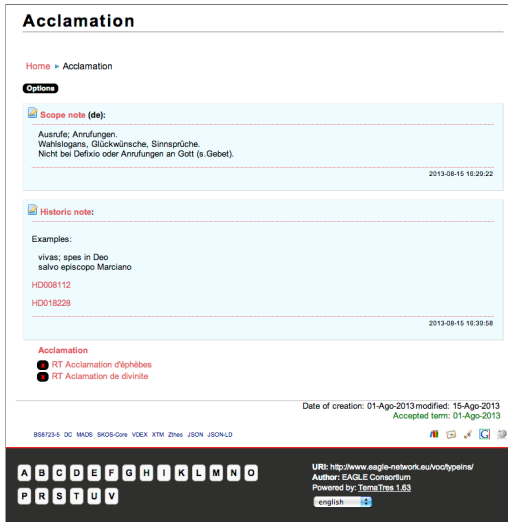


Do not forget to save clicking on INSERT.

Figure 11: Tematres Tutorial

Bibliography can be entered in the same way, but into a BIBLIOGRAPHIC NOTE rather than into a SCOPE NOTE or an HISTORIC NOTE

The two examples above will then look like this



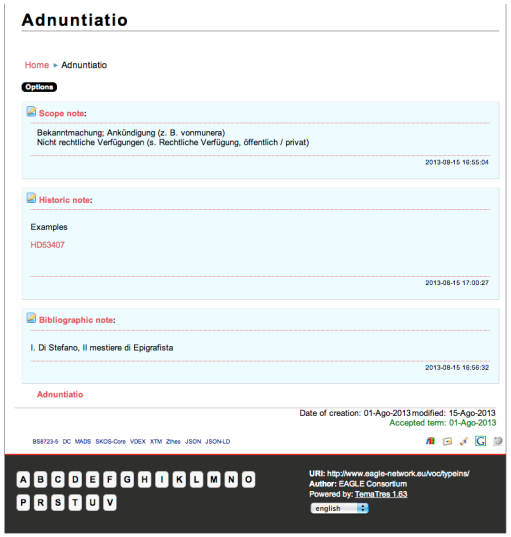


Figure 12: Tematres Tutorial

4 Target Vocabularies

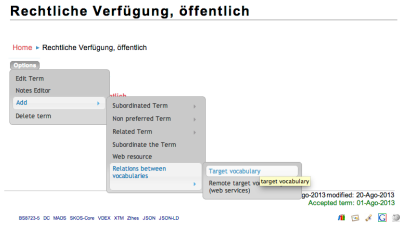
There will be one target Vocabulary for each Content Provider.[1] These will contain only those of the terms which have not been chosen to be part of the common vocabulary. In this way the target vocabulary will contain only values which are unique to the Content provider using them and not the ones which align with something else.

vocabulary configuration - [Add target vocabulary]

Title	Author	Type
EAGLE Vocabulary - Type of Inscription / fr	EAGLE Consortium	vocabulary
Type of Inscription EDH / de	EDH	target vocabulary
Type of Inscription EDR / it	EDR	target vocabulary
Type of Inscription HE / es	HE	target vocabulary
Type of Inscription EDB / it	EDB	target vocabulary
Type of inscription PETRAE / fr	PETRAE	target vocabulary
Type of inscription UOXF / en-GB	UOXF	target vocabulary
Type of Inscription LUPA / de	LUPA	target vocabulary

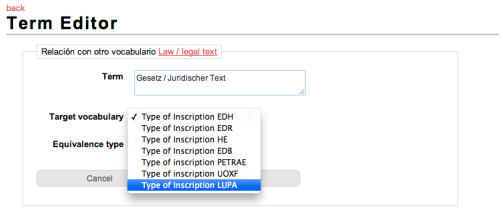
8

These terms shall be added from the google drive tables one by one to guarantee as much exactness as possible. This is done by selecting Option and then as in the image below



[1] General informations about each can be modified upon request, like Copyright statements and authorship, as well as URI. Most target vocabularies are already in place, where not they will be created.

The term entered can be copied from the Google spreadsheet (See p.xxv below) and the correct target vocabulary can be chosen from the appropriate menu as below. Equivalence type can be safely left stating full equivalence.

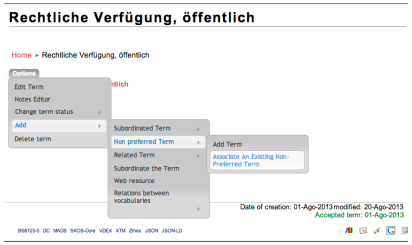


The same will happen if we insert another term of another target vocabulary with a result which looks like the one below, when one should end up on the page of this target terms and not on a main term.

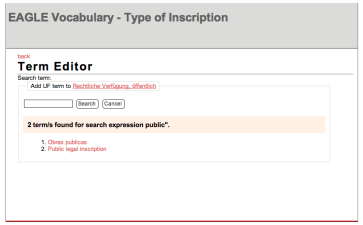
Figure 13: Tematres Tutorial

5 Non preferred terms

Tematres allows a form of *redirect* which makes possible to have an entry also for each non selected main term, without using that URI and stating what the preferred one is. This will be useful to add all translated entries in the alignment.[2] These terms can get independent definitions and URIs, but there will always be a prioritary link to the preferred term.

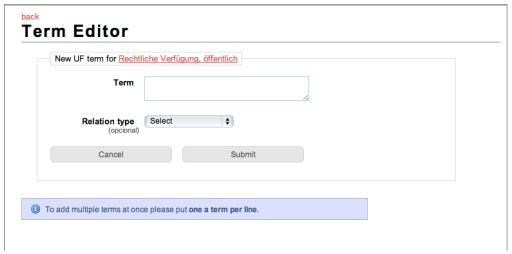


Non preferred terms can be inserted and then related this way, as the system will search for them.



[2]See selection principles at p.xxvi

Or they can be added anew, selection ADD TERM instead of select existing.

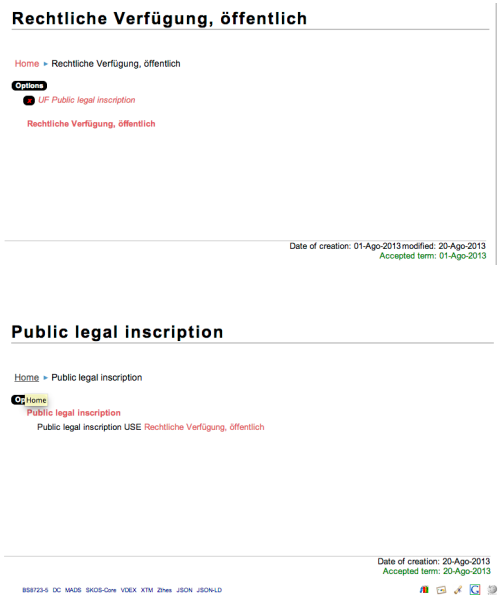


Here as in the normal insert term option multiple terms can be entered at once, one in each line, or copy-pasting from a table.

N.B.: No RELATIONAL TYPE needs to be added at this stage, unless we commonly decide to do so.

Figure 14: Tematres Tutorial

The result will be as follows for main and non-preferred terms



These will be the results of multiple relations statements, including target vocabularies (EQ), related terms (RT) and non preferred terms (UF).

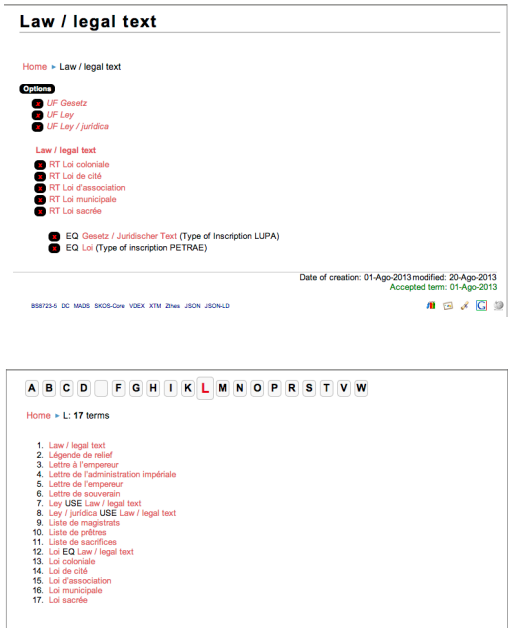


Figure 15: Tematres Tutorial

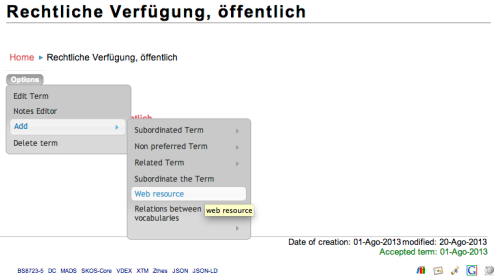
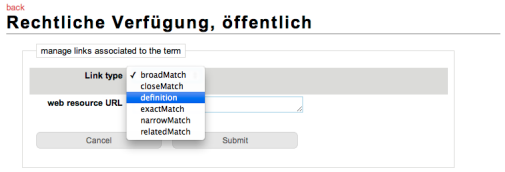
6 External definitions

There are definitions we want to take from existing vocabularies, as for materials. The easiest and more functional way to do this is to add a "Web resource". The example below shows how to do this.[3]



A DEFINITION option has been provided in the menu to be selected for this purpose. It is possible to add other options, please, just ask if you reckon that we need more.



[3] The entry has then been removed as it is incorrect and has been only used to show the procedure.

Then in the WEB RESOURCE URL the link (available in the google spreadsheet see xxv.) to the existing Thesaurus can be inserted, with the following result.

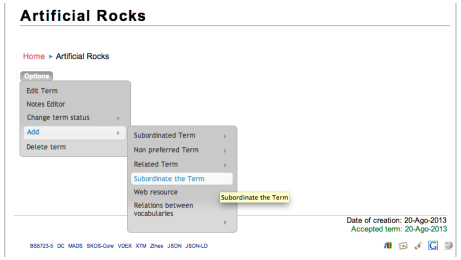
Figure 16: Tematres Tutorial

7 Hierarchy

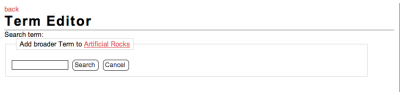
Only the Material vocabulary will require Hierarchical organization. This is supported by Tematres and will be done as follows, from the lower status groups.

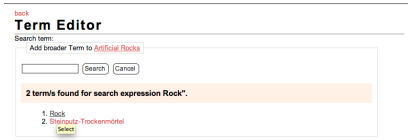
Start from a subordinate term.

Select as below



Then follow instructions to search and select





You can also add lower level items (convenient option only for maximum lower level) by selecting as below and following passages in the ways described above for other relation types.

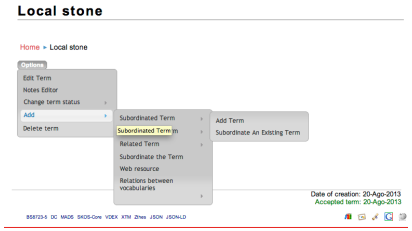


Figure 17: Tematres Tutorial

You will get this view respectively for the main and subordinate term, which will also reflect into a list of main level terms in the home page

xxiii

xxiv

Figure 18: Tematres Tutorial

8 Eagle Vocabularies specifications

The alignment of the vocabularies is carried out here and it is very important to keep always track of relevant modification (new entry and related id e.g.) in these tables.

Type of Inscription : `http://goo.gl/KHwTh`

Object type : `http://goo.gl/FL1wW`

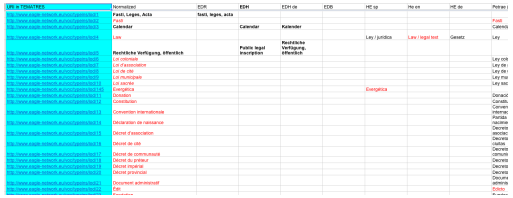
Material : `http://goo.gl/EqeCD`

Writing : `http://goo.gl/cbRXd`

Decoration : `http://goo.gl/znT2C`

State of preservation : `http://goo.gl/GbqLB`

Dating Criteria : `http://goo.gl/W9Bge`



These alignment will remain the background working documents to be reflected into the vocabularies. Red cells indicate unsolved problems at technical or alignment level.

The general list will be developed and maintained in these documents.

In each vocabulary you will now find a URI column and a Normalized entry (with capital letters)

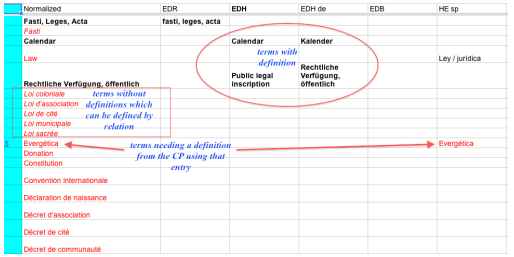
On occurrence of aligned terms, the language more attested is used, or the one which has a definition. Where there are conflicting options the English is

chosen and where no English is available the Latin. Where only attested in one vocabulary, the original language of that vocabulary is chosen.

There is no evident need to preserve the numbered URIs of redirecting entities in this spreadsheets. content enrichment can be more conveniently done with the use of the aligned vocabulary only.

Bold entries indicates that the specific entry has a definition given by that Content Provider (in the column). Where multiple bold entities are present a common definition needs to be given. In these cases the term in the normalized column is underlined, and temporarily both definitions are inserted in the Tematres entry of the main term.

Where no bold entry is present a definition needs to be entered. The red text indicates the chosen language and therefore the priority is given to the initial users of the term to provide a definition with examples and references. Where simple relations could provide for a definition from a related term, italic is used in the Normalized text field. These entries would still need examples.



A red bold entry denotes a text which has a definition which needs to be updated to meet the agreed Eagle standards.

It is advisable to enter only one term in one language for each of the aligned terms as there suggested. In a second phase we will then add all specific terms and add additional definition where needed[4]

[4]In cases where the term adheres to the general definition but applies only to a selection of items or has a contextual delimitation to be applied.

Figure 19: Tematres Tutorial

Please, while using Tematres always look out for consistency of use of this principles and point out problems to the list.

Each term will acquire in Tematres a URI in this form
`http://www.eagle-network.eu/voc/typeins/lod/113`
where the part after voc is the name of the vocabulary and the number is a unique reference into the specific vocabulary.[5]

This link will point to the tematres resource, while
`http://www.eagle-network.eu/voc/typeins/skos/113`
will lead directly to the SKOS version.

The number and the /lod URI shall be referenced back into the google spreadsheets to guarantee consistency.

In this way, entries my be added or deleted while URI will not change.

If a term will be deprecated after release of the vocabularies, the term will not be deleted, as it might be in use, but referred to the correct entity with the relational options of Tematres.

[5] NB: this is not the consecutive number in each letter list.

Figure 20: Tematres Tutorial

Using the Eagle MediaWiki: a Tutorial

Eagle MediaWiki Tutorial

October 9, 2013

1 Introduction

Eagle MediaWiki can be found at http://www.eagle-network.eu/wiki.

This document is intended to provide you a click-by-click tutorial on how to use this tool to edit records of inscriptions and add images from the web or translations. Eagle MediaWiki is the software on our website powering the wiki and the extension Wikibase has been installed to work on data in WikiData, one of Wikimedia foundation newest project dealing with data, of which we are very proud to be part.

This space specifically is intended to be our multilingual wiki (D2.5) and performs two main functions:

1. gather all translations together with the possibility to add more translations in different languages.
2. gather and connect all those images of inscriptions which are online but unrelated to our databases.

Wikimedia Commons[1] has more than 6000 records in the category "roman inscriptions" most of which without any link to our databases in the consortium.

- Corpus Inscriptionum Latinarum
- Roman Inscriptions by publication
- Ancient Roman Inscriptions
- Ancient Greek Inscriptions

Flickr (which cannot currently be linked this way automatically has other 6000 ca, but many more are uncategorized, although they might have a pleiades id

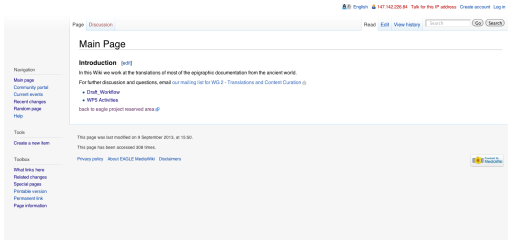
Later on, when CP will upload to Wikimedia Commons their images they will be automatically imported as records to this Wikibase so that translations can be added.

[1] Wikimedia Commons is a project of the Wikimedia Foundation as Wikipedia and Wikisource to archive and make available photos and media.

Figure 21: Mediawiki Tutorial

2 Log in

When you are in the MediaWiki you can create your account by clicking CREATE ACCOUNT on top right corner.



Alternatively you can click on LOG IN and use the following :

username: **Eagle-reserved**

password: **epigraphy**

3 Overview

There are then three kinds of actions which we can do:

- Add a new record entry with a new translation. (4)
- Edit an existing record adding a translation (5)
- Edit an existing record an image from Wikimedia Commons (6)

Translations can be:

- published (7)
- authored (8)

Our WikiBase provides options for all cases.
We have developed the initial model from EDR into a flexible WikiData template

And the result we can get looks like the one in this example

4 Add a completely new record

Please, note that existing translations will be imported automatically by the Wikimedia Italia Team. Each partner will have to decide for a Selection of text to translate according the survey and the DOW. Principles for selection shall be discussed in advance during a WG meeting.

If you want to insert a translation of your own into the wikibase first of all, please check if there is a record from another database for that text and then follow the instructions to edit that record (5).

Once all inscriptions will have a TM_id this will be easy, searching for the TM, before that you can browse this page: ALL ITEMS Which can also be opened from the sidebar.

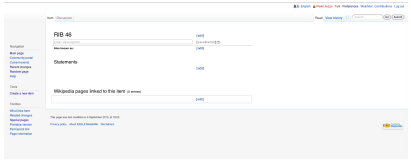
When you are sure that the inscription you want to edit is not in the MediaWiki, then please, add it. To do this click on CREATE A NEW ITEM in the menu list on the left.

N.B.: Any action can be edited and modified by any member of our BPN. All changes are tracked and can be retrieved.

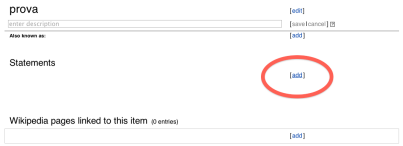
In "LABEL", please enter the TM_ID if this exists already or the id of the CP who has a record for that particular inscription. In "DESCRIPTION" you can either copy the title of the text if there is one or add it anew. You can also leave it blank.

Figure 23: MediaWiki Tutorial

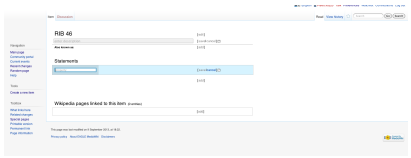
Click on CREATE and you will get this result:



Each information added is into a STATEMENT. To add informations, click on ADD at the bottom of the page as shown below.



A blue form will open so that you can insert your data.



In case you are editing an existing item the correct ADD button is the one shown below.

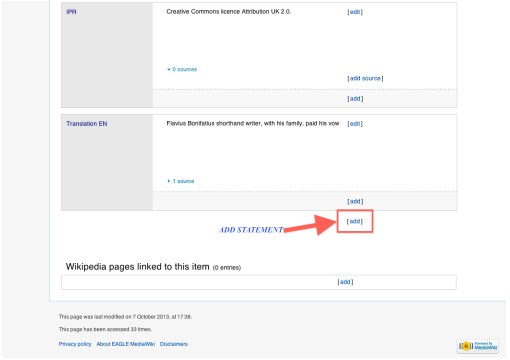


Figure 24: MediaWiki Tutorial

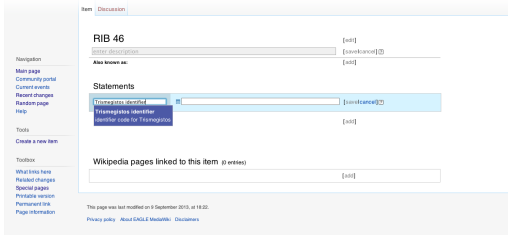
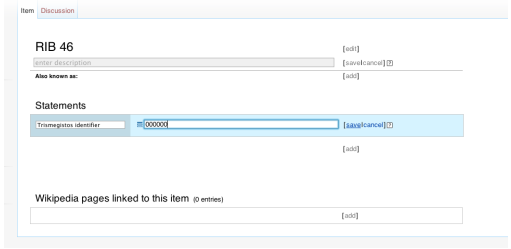
First of all insert a property, which is what kind of information you want to insert. WikiBase will suggest you values based on the ones which are preset for our needs.

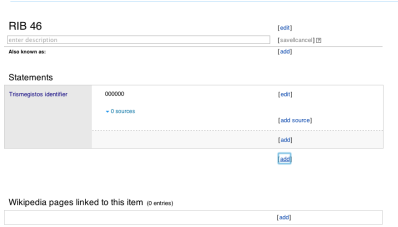
The order in which you add informations is unimportant.



Then write the information itself into the field in light blue. and remember to click on SAVE.



You should get something like this, where you are then able to add further Properties and Sources.



In the following image, for example, one further identifier is added. N.B.: URI are built automatically, so inserting the id value, you will get automatically a link to the entry in the Content Provider website.

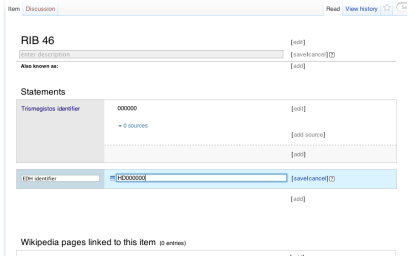


Figure 25: MediaWiki Tutorial

The following is a list of properties currently available, more can be added if needed after discussion in the WG.

Identifiers

- Trismegistos identifier (property:P3)
- HispaniaEpigraphica identifier (property:P22)
- EDH identifier (property:P24)
- EDH foto identifier (property:P39)
- EDR identifier (property:P38)
- EDB identifier (property:P37)
- BSR identifier (property:P40)
- Petrae identifier (property:P33)
- CYI identifier (property:P36)
- DAI identifier (property:P35)
- Ubi Erat Lupa identifier (property:P34)

Translation's languages

- Translation EN (property:P11)
- Translation DE (property:P12)
- Translation IT (property:P13)
- Translation ES (property:P14)
- Translation FR (property:P15)
- Translation EL (property:P16)
- Translation RU (property:P17)
- Translation SI (property:P18)
- Translation HU (property:P19)
- Translation RO (property:P20)

WikiData will never force you to insert data. Our project needs instead to have some data clearly stated. Therefore, when you create a new record there must be:

- the TM_id if it exists (most already do)
- at least one identifier of a content provider
- the IPR (property:P25) declaration or the source of the translation (7)

Figure 26: MediaWiki Tutorial

5 Edit an existing record

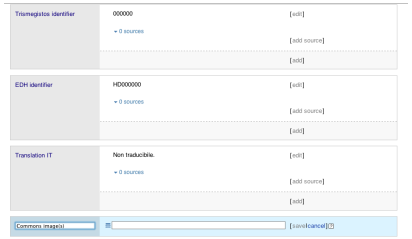
Imported texts will look like this or the one on the following page, depending on the original data.

If you want to search for an existing item you can use the search box or browse the list of all records: all items. To add another translation or image, just follow the above procedure (4 and 7 or 6)

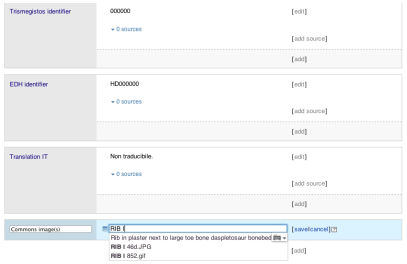
Figure 27: MediaWiki Tutorial

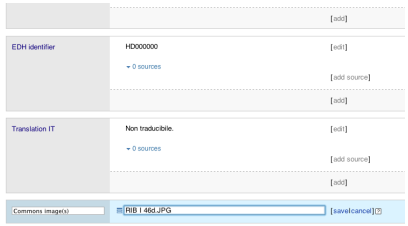
6 Insert an image published on Wikimedia Commons

Among the properties available, one is Image(s). Select it when creating a new Statement.



In the value you can start typing and the system will search Wikimedia Commons for you. If you know the name of your file in Wikimedia Commons, you can simply paste it.





Once you have chosen, the name will directly link to the file on Wikimedia Commons.

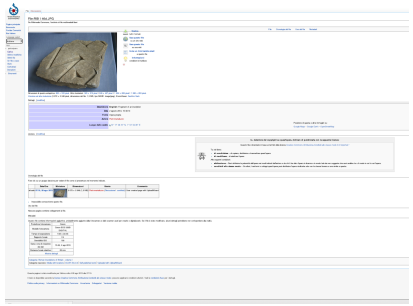


Figure 28: MediaWiki Tutorial

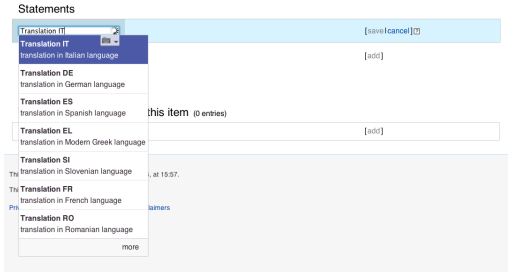
7 Insert a published translation

If you have a translation in a publication which you would like to enter in the wikibase, this requires as normal the statement of the source.

Select first the language of the translation. If it is not in the list, let us know, it will be added as soon as possible if not immediately.



Copy the text in and remember to SAVE.

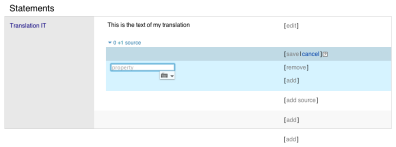
Then click on the ADD SOURCE button.

This will give you the opportunity to insert a series of other properties, from this list:

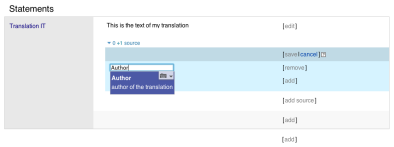
- Publication title (property:P26)
- Volume (property:P27)
- Place (property:P28)
- Year (property:P29)
- Pages (property:P30)
- Name of translation's author (property:P21)
- Periodical title (property:P32)
- IPR (property:P25)
- Publisher (property: P41)

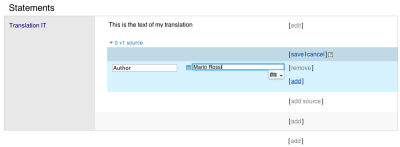
Figure 29: MediaWiki Tutorial

Insert as many informations as you can. Your browser should remember them so that next time you enter some text it will suggest you the one you have already written.

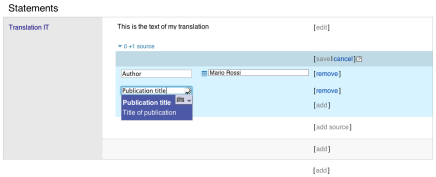


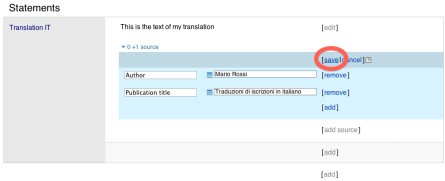
As for statements, start to type the name of the property, in any order, and then insert the value.





You can add as many property as possible, but do not forget that until you click SAVE they will not be saved.





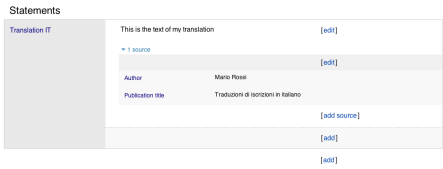


Figure 30: MediaWiki Tutorial

8 Insert a new translation

To insert a new translation, all you have to do is edit an existing item (5) and add in source the Author with the correct value and the IPR statement chosen (suggested statement is a CC BY-SA license).
